# National Forest Monitoring Systems for REDD+

## Presentation 2

## NFMS for REDD+ Part 2

### Objectives:

- Identify the components of a national forest monitoring system for REDD+
- Understand the key principles of the IPCC's guidance and guidelines for measurement, reporting and verification (MRV) for REDD+
- Understand the steps involved in MRV for REDD+
- Understand the objectives and tools for forest monitoring for REDD+

National Forest Monitoring Systems for REDD+

# **MRV FOR REDD+: IPCC GUIDANCE AND GUIDELINES**

**NEWSROOM**

- Science
- Adaptation
- National Reports
- GHG Data
- Methods

### REDD Web Platform: IPCC

The Intergovernmental Panel on Climate Change (IPCC) guidelines and good practice guidance provide methodologies that can form the basis for how developing countries estimate and monitor emission reductions from deforestation and forest degradation and changes in forest carbon stocks.

IPCC Guidance

<a href="#">IPCC-NGGIP</a>	IPCC-National Greenhouse Gas Inventories Programme
<a href="#">2006 IPCC Guidelines</a>	2006 IPCC Guidelines for National Greenhouse Gas Inventories (5 Volumes)
<a href="#">GPG-LULUCF</a>	Good Practice Guidance for Land Use, Land-Use Change and Forestry

# Which IPCC Guidelines to use?

Currently, all the Parties use these under the UNFCCC and the Kyoto Protocol.

Annex I Parties shall use GPG.  
Non-Annex I Parties are encouraged to use GPG.

GPG2000  
(non-LULUCF)

GPG2003  
(LULUCF)

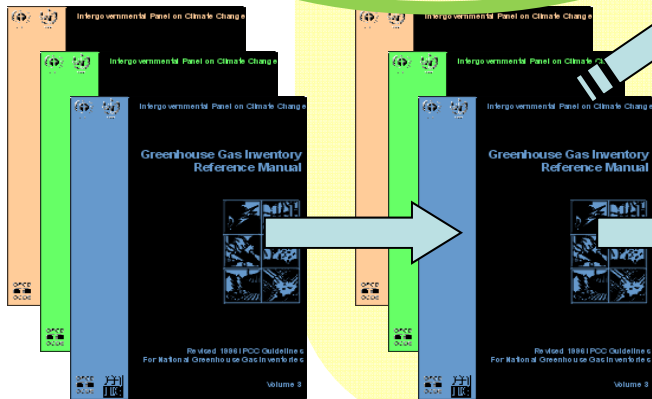

Annex I Parties  
must use from 2015

2006 IPCC  
Guidelines

2013  
Wetlands  
Supplement

1995 IPCC  
Guidelines

Revised 1996  
IPCC Guidelines

Revision/Update by the IPCC

# IPCC Good Practice Guidance: Key Concepts

- IPCC “Good Practice”:
  - Assists countries in **producing GHG inventories** that are accurate in the sense of being **neither over nor underestimates** so far as can be judged, and in which uncertainties are reduced as far as possible
  - Provides methods to **manage uncertainties**
  - Supports the development of GHG inventories that are:
    - Transparent
    - Documented
    - Consistent over time
    - Complete
    - Comparable
    - Assessed for uncertainties
    - Subject to quality control and assurance
    - Efficient in the use of resources available to inventory agencies
    - In which uncertainties are gradually reduced as better information becomes available

## IPCC G&G: Key Concepts

- **Activity Data**
  - Data on the **magnitude** of human activity, resulting in emissions/removals taking place during a given period of time (e.g. data on land area or management systems)
- **Emission Factor**
  - A **coefficient** that relates the activity data to the amount of chemical compound (e.g. CO<sub>2</sub>), which is the source of later emissions
- **Removal Factor**
  - **Rate** at which carbon is taken up from the atmosphere by a terrestrial system and sequestered in biomass and soil

MRV for REDD+

# IPCC Equation for Emission Estimates

## MEASUREMENT

Area change data  
from satellite  
remote sensing

Forest carbon  
stock change data  
from a national  
forest inventory

Inventory of  
greenhouse gas  
emissions from  
the forest sector

ACTIVITY DATA

EMISSION  
FACTOR

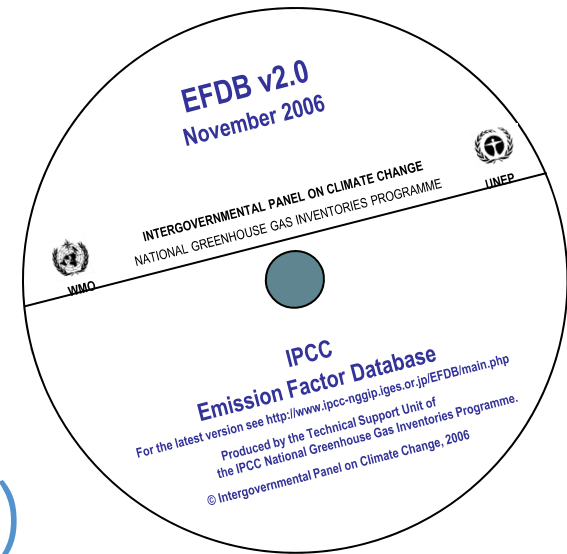

EMISSIONS  
ESTIMATE

# IPCC Products – internet, CD & USB

<http://www.ipcc.ch/>

- IPCC Software
  - Implements methodologies
  - Calculates GHG
- Emission Factor Database (EFDB)
  - Repository of emission factors for use by compilers

# The IPCC: Using the Guidelines

IPCC

- Go to the Guidelines (on internet, CD or USB stick at end of workshop)

2006 GL

- Choose which version of Guidelines to use
- Most up-to-date version of guidance (2006) are “encouraged” but 1996 are min.
- Comprehensive description of Methods

Volume 4

- Volume on Agriculture, Forestry and Other land-use (AFOLU)
- General introduction, land representation, inventory circumstances
- Detailed description of each land-use Category

Aux Docs  
and soft  
ware

- Consulting Group of Experts
- IPCC summaries
- UNFCCC Documents, IPCC software available to assist calculations and reporting

NFIs for Assessing Emission/Removal Factors

# IPCC CONCEPTS: REPORTING TIERS AND KEY CATEGORIES

# Emission Factor Reporting Tiers

- **Tier 2:** Applies country- or region-specific emission and stock change factors for the most important land-use categories
  - Country-defined EFs (for climatic regions and land-use categories)
  - *IPCC default assumptions + default methodology ('Good Practice Guidance and LULUCF Annex 1') + country-specific data*
- **Tier 3:** Higher order methods are used (e.g. **inventory measurement systems**) tailored to **address specific sources**, **repeated over time** and **driven by high-resolution data** that are **aggregated** at sub-national level
  - Estimates have **lower uncertainty** than lower tiers
  - **Intensive field sampling** repeated at regular time intervals
  - **Inventory systems** of age, class/production data, soils data
  - *Country-specific assumptions + methodology + data*

**Objective = To reduce uncertainty as much as possible**

Assessing Emission & Removal Factors e.g.:

# The Hierarchical Tiers for Living Biomass Estimation

Emission / Removal Factor	Tier 1	Tier 2	Tier 3
<b>Annual biomass growth rate</b>	<ul style="list-style-type: none"> <li>• Default values from IPCC 1996GL and GPG2003</li> <li>• Emission Factor Data Base (EFDB)</li> </ul>	<ul style="list-style-type: none"> <li>• Default values from IPCC 1996GL and GPG2003</li> <li>• Country-specific data</li> <li>• EFDB</li> </ul>	<ul style="list-style-type: none"> <li>• National Forest Inventory or modelling approaches</li> <li>• Allometric equations</li> </ul>
<b>Carbon fraction of dry matter</b>	<ul style="list-style-type: none"> <li>• Default data of 0.5</li> </ul>	<ul style="list-style-type: none"> <li>• Default data of 0.5</li> </ul>	<ul style="list-style-type: none"> <li>• Species-specific data from laboratory estimations</li> </ul>
<b>Biomass Expansion Factor (BEF)</b>	<ul style="list-style-type: none"> <li>• Default values of 1.8</li> </ul>	<ul style="list-style-type: none"> <li>• Default values of 1.8</li> <li>• National data for key forest types</li> </ul>	<ul style="list-style-type: none"> <li>• Species-specific data from measurements</li> </ul>

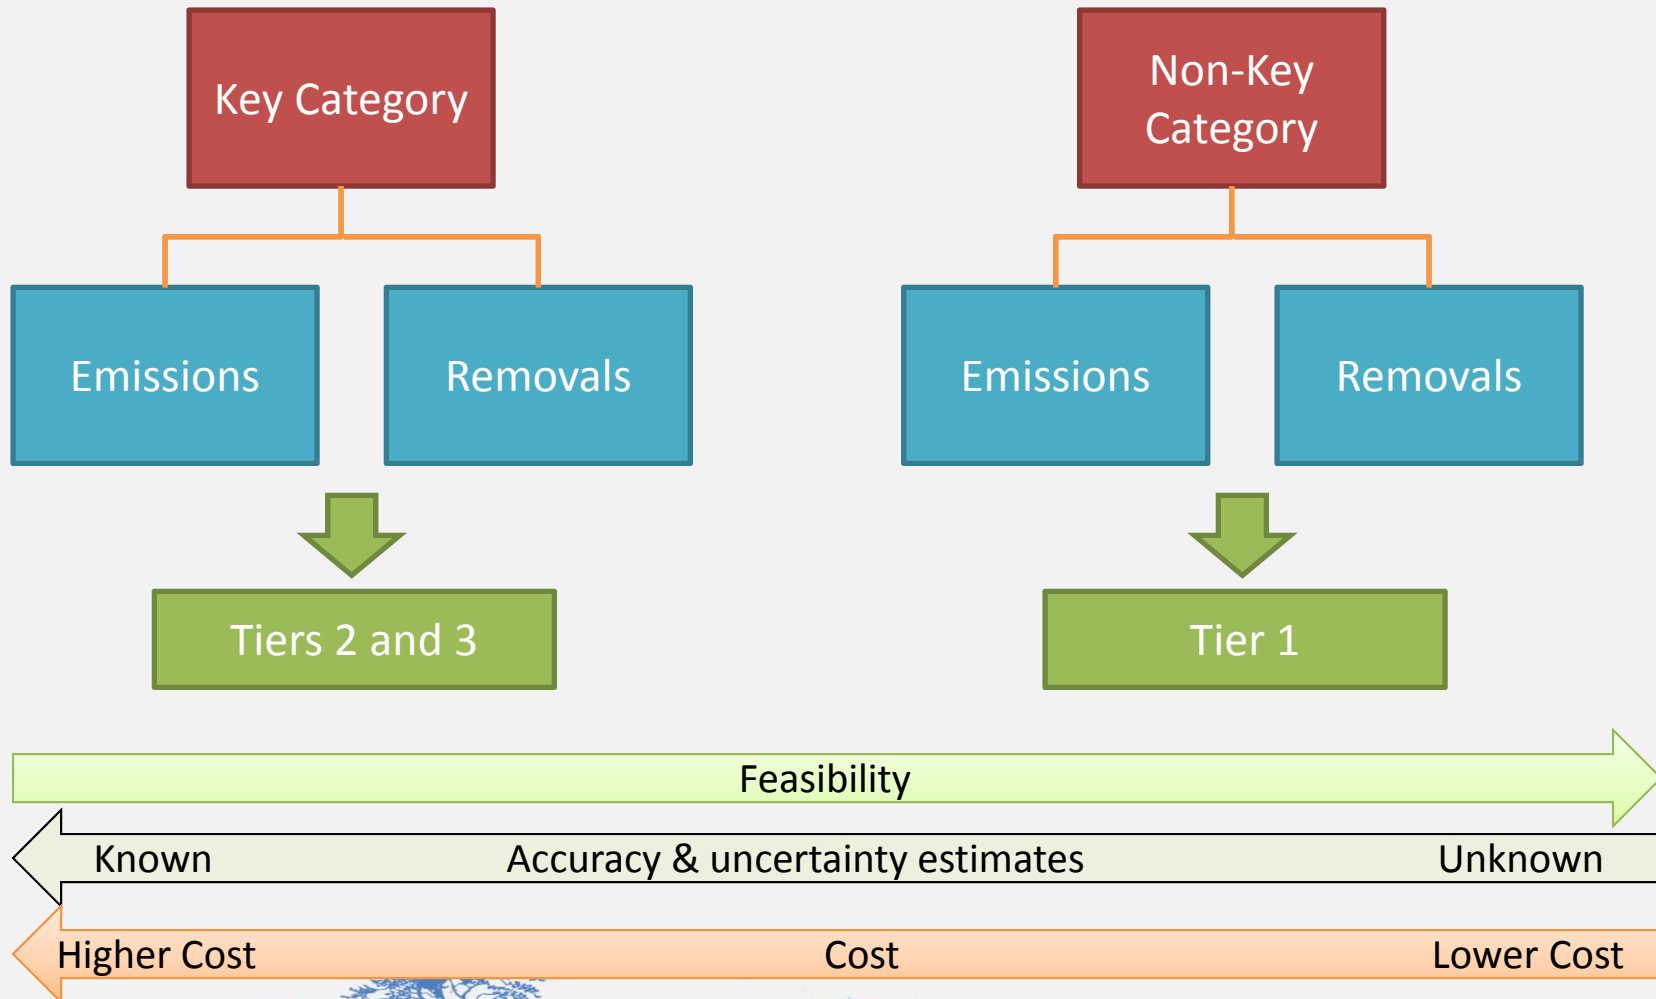

# Combining Tiers & Methods

- Can adopt **multiple tiers** in GHG inventory for the LULUCF sector:
  - For different **land-use categories**
    - E.g. tier 2 for forest land and tier 1 for grassland
  - Within a given land-use category **for different carbon pools**
    - E.g. tier 1 for below-ground biomass and tier 2 for above-ground biomass
- For higher tiers countries need to have more sophisticated methods, documentation, and data.
  - E.g. known large source
  - E.g. fast increasing source
  - E.g. emissions from land-use often not exactly known
  - E.g. country-specific, climatic region-specific emission/removal factors
- Higher tier source/sink **adopted for key categories** (wherever possible) together with the use of country-specific, climatic region-specific emission/removal factors
  - Key Category = “a category that is prioritized within the national inventory system because its estimate has a **significant influence on a country’s total inventory of GHGs** in terms of the **absolute level, the trend, or the uncertainty in emissions and removals**” (IPCC)
    - HELP TO **PRIORITIZE ALLOCATION** OF EFFORT AND RESOURCES

# Linking Key Categories and Tiers

# Key Category Analysis

- Key category analysis helps a country to achieve the most reliable inventory given the resources available
- Key category analysis is required to identify which:
  - land-use and **management activities** are significant
  - land-use **sub-category** is significant
  - CO<sub>2</sub> emissions/removals by sinks from **various carbon pools** are significant
  - **Non-CO<sub>2</sub> gases** and from what categories are significant
  - **Tier is required** for reporting
- A certain land category (e.g., *Land Converted to Forest Land*) and further a certain carbon pool (e.g., above-ground biomass) may contribute to a dominant share of net CO<sub>2</sub> emissions/removals →
  - Aim to get **better data for this key category**

National Forest Monitoring Systems for REDD+

# MRV FOR REDD+: ACTIVITY DATA

## Key Concepts: Land Representation

Systems for land representation should be:

- **Adequate**: capable of representing land-use **categories**, and **conversions** between land-use categories, as needed to **estimate carbon stock changes** and greenhouse gas **emissions and removals**
- **Consistent**: capable of representing land-use categories **consistently over time**, without being unduly affected by artificial discontinuities in time-series data
- **Complete**: that **all land** within a country should be included, with increases in some areas balanced by decreases in others, recognizing the bio-physical stratification of land if needed
- **Transparent**: data sources, definitions, methodologies and assumptions should be clearly described

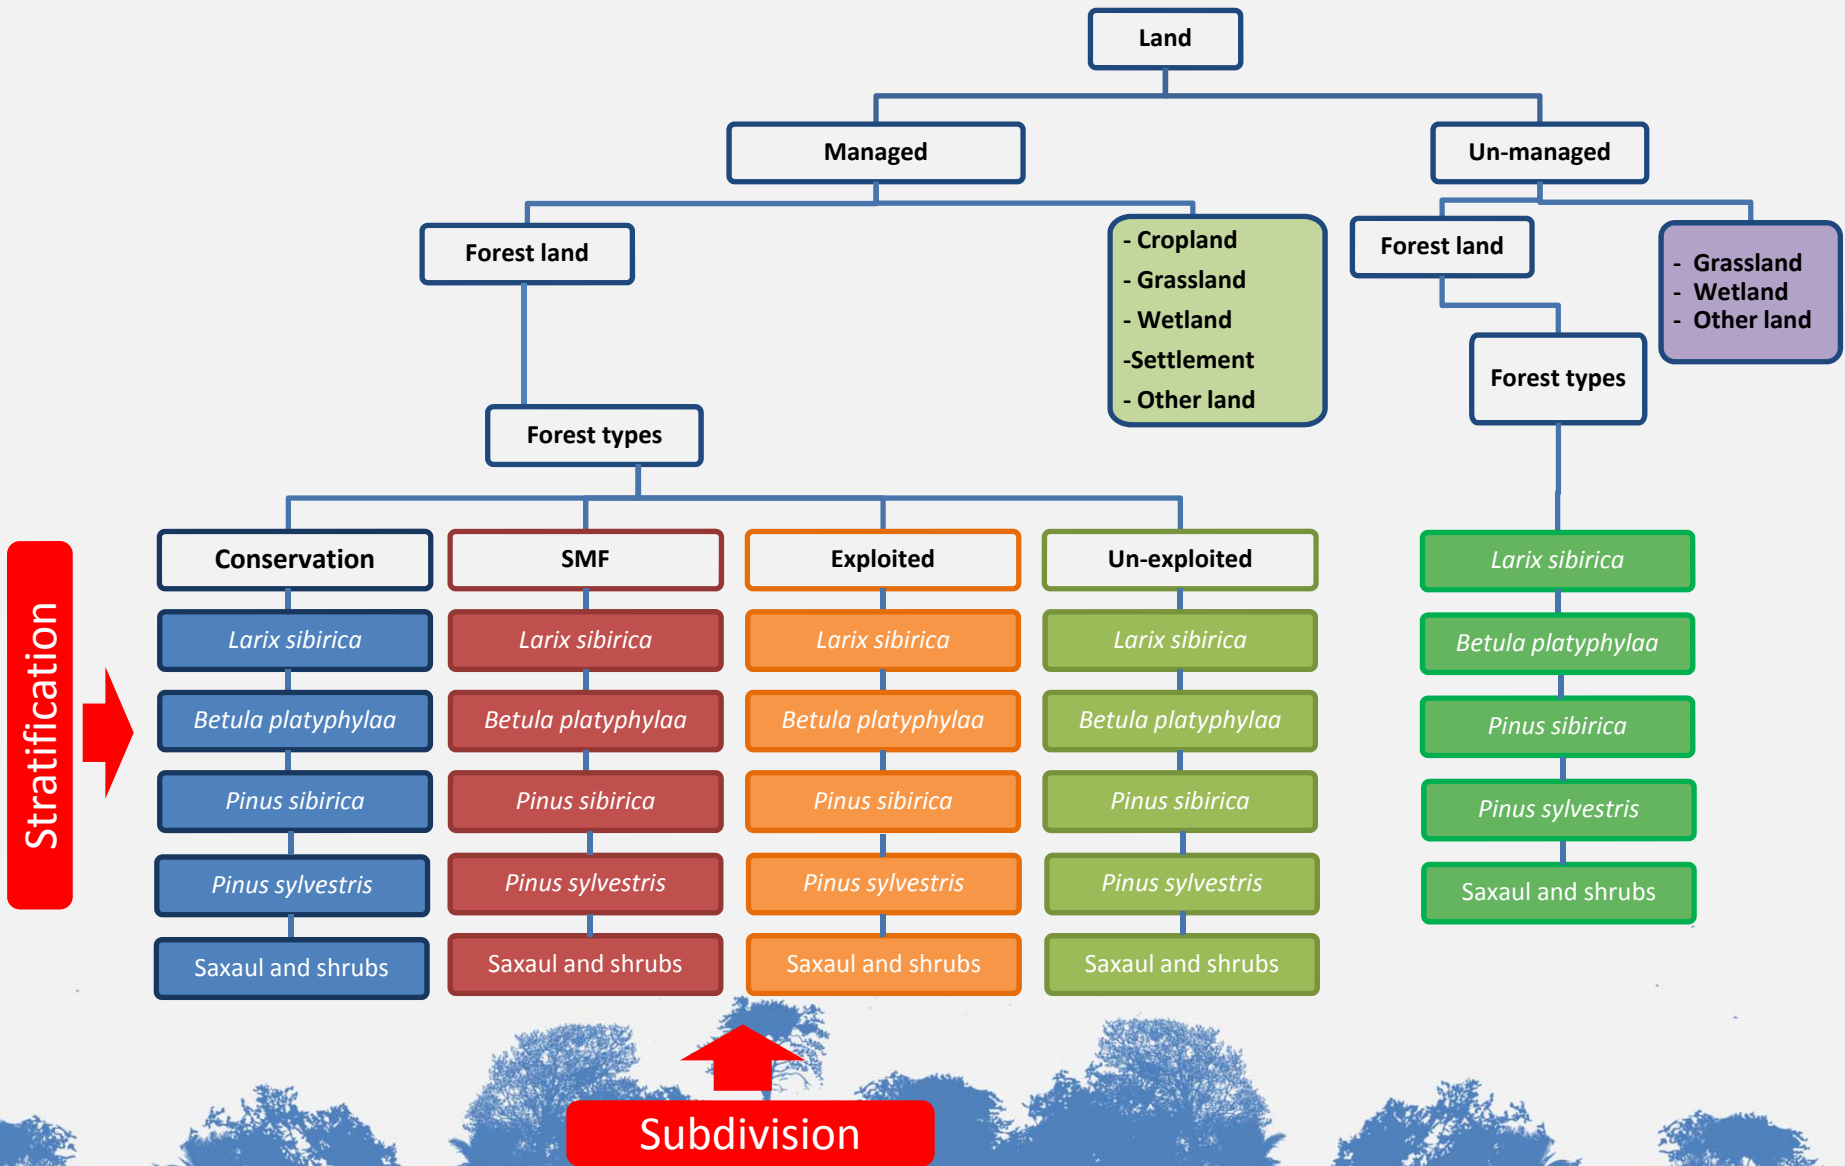

## Key Concepts: Land Representation

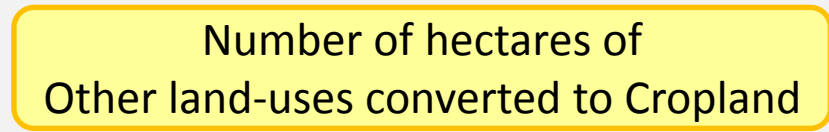

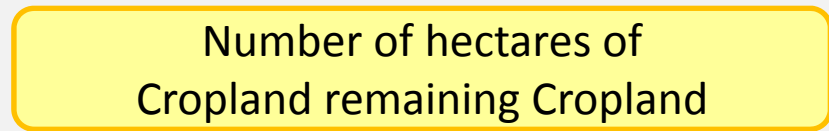

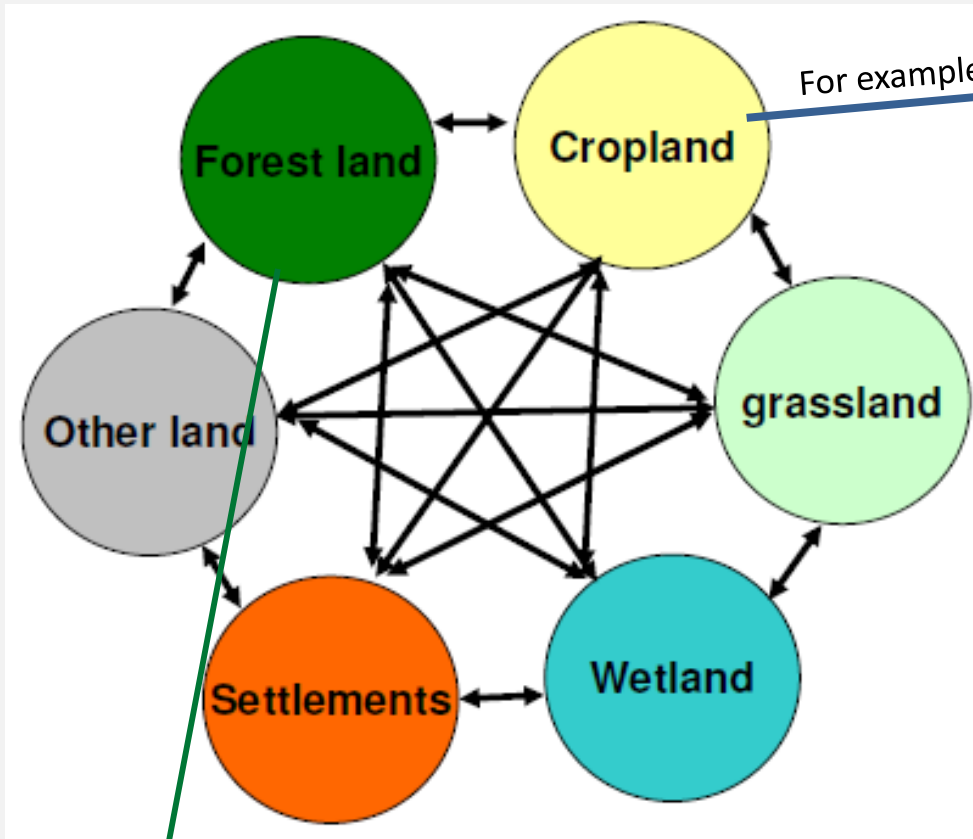

- IPCC uses 6 land-use categories
  - Forest land, Grassland, Cropland, Wetland, Settlement, Other land
- Each land-use category is further disaggregated to reflect the past and the current land-use, for example under forest land you report the sub-categories:
  - Forest land remaining forest land
  - Lands converted to forest land
- Land-use categories and sub-categories may be further sub-divided according to land-use practices or biophysical characteristics of the land
  - For example: forest land sub-divided by forest type:
    - Lowland tropical forest
    - Mangroves

# A Potential Forest Land Stratification for Mongolia & GHG Reporting Sub-Divisions for REDD+

# Activity Data: Assessment of change

To assess deforestation, we want to know the area of Forest Land converted to other land-uses – this all gives an indication of the drivers of deforestation

# Activity Data: Assessment of Change

- IPCC guidance: Countries should **characterize and account for all relevant land areas** in a country consistently and as transparently as possible.
- Data should reflect the **historical trends in land-use area**
- IPCC 2003 LULUCF Guidance suggests three Approaches:
  - **Approach 1: Basic land-use data** (land-use types in time 1 & land-use types in time 2)
  - **Approach 2: Survey of land-use and land-use change** (changes from & to a category)
  - **Approach 3: Geographically explicit land-use data** (known locations of changes between categories)
- In most developing countries the only way to represent land in a consistent and transparent way with a historical time frame of 20 years is the use of **satellite remote sensing data**, which allows the adoption of Approach 3

# Activity Data: Assessment of Change

## Approach 3: Geographically Explicit land-use Data

- Requires **spatially explicit observations of land-use and land-use change**.
- The data may be obtained either by 1) **sampling** of geographically located points, 2) a complete tally (**wall-to-wall mapping**), or 3) a **combination** of the two
- Is comprehensive and relatively simple conceptually but **data intensive** to implement

# Activity Data in the GHG Inventory

National Forest Monitoring Systems for REDD+

# **MRV FOR REDD+: EMISSION & REMOVAL FACTORS**

# Emission/Removal Factors

- **Emission factor**
  - A coefficient that relates the activity data to the amount of chemical compound that is the *source of emissions*
  - LULUCF: emissions of  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{CO}$ ,  $\text{N}_2\text{O}$  and  $\text{NO}_x$  resulting from land-use (change) and forestry activities (measured in tonnes  $\text{CO}_2$  eq. /ha)
- **Removal factor**
  - *Rate at which carbon is taken up from the atmosphere* by terrestrial systems and sequestered (stored) in biomass and soil (measured in tonnes  $\text{CO}_2$ eq./ha)
- Emission/removal factors are often based on a sample of measurement data *averaged to develop a representative rate of emission or removal* for a given activity level under a given set of operating conditions (e.g. logging, deforestation, reforestation)

# The 5 Forest Carbon Pools

# Emission/Removal Factors in a GHG Inventory (example from a UNFCCC table)

# Designing National Forest Inventories (NFIs) to Assess EFs

UN-REDD  
PROGRAMME

- Estimation must be made:
  - For carbon stock **CHANGES!**
  - For diverse **ecological conditions** and/or **management regimes**
  - Emissions and removals due to **human activity**
  - For changes in all 5 carbon pools (wherever poss.)

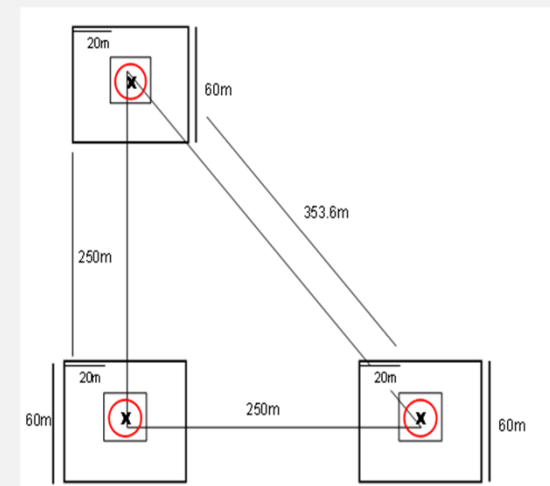

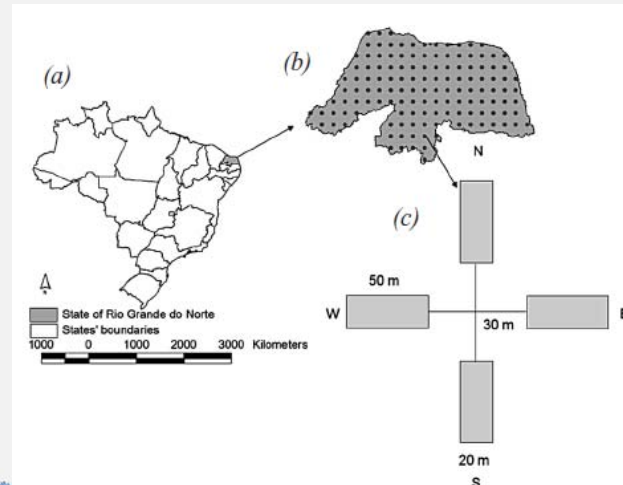

Multi-Data Change without uncertainty	EF Tier 1
Multi-temporal Change with uncertainty	EF Tier 2
Multi-temporal Trend with uncertainty	EF Tier 3

- IPCC requirements for NFIs
  - Estimations of Emission Factors made to Tier 2 or Tier 3 level – this requires:
    - **Country-specific** estimates of emission factors
    - **Multi-temporal** inventory data
    - **Uncertainty analysis**
    - Quality Assurance / Quality Control (**QA/QC**)

# National Forest Inventories (NFIs)

- The goal of a NFI is to generate information for:
  - **Decision making** (national / sub-national)
  - **Monitoring** in forestry & related sectors
- **41 out of 42** Annex 1 countries **use NFIs** as a data source to compile their national GHG inventory
  - Fulfills IPCC requirement of '**completeness**'
- Diverse approaches around the world

## 2 ways of Measuring Changes in forest carbon

### 1) Stock-Difference and

#### METHOD 1

##### Stock-difference

The difference between carbon stocks gives carbon emissions

Carbon<sub>1</sub> : Carbon stocks time<sub>1</sub>

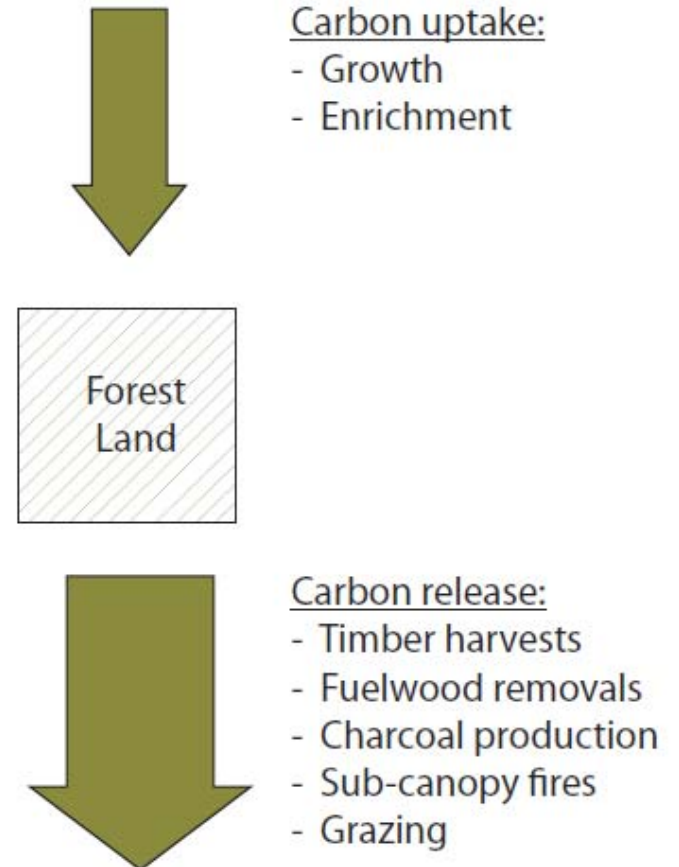

Carbon<sub>2</sub> : Carbon stocks time<sub>2</sub>

### 2) Gain-Loss

#### METHOD 2

##### Gain-loss

Carbon emissions are calculated from gain minus loss

National Forest Monitoring Systems for REDD+

# MRV FOR REDD+: REPORTING

# What is Reporting for REDD+?

- Two ways for countries to report to the UNFCCC on progress with REDD+:
  1. **National communications** (shortened to NC)
  2. **Biennial Update Reports** (shortened to BUR)
- Countries **voluntarily** report with a Technical Annex to the BUR if they want to **access REDD+ finance**, based on results from the implementation of REDD+ activities
- **National Communications** include data and information on:
  - National circumstances
  - Vulnerability assessment
  - Financial resources and technology transfer for climate change
  - Education, training, public awareness
  - **National GHG inventory**

# Reporting for REDD+

## Transparent

- Sufficient and clear documentation showing how inventory was compiled
- Following Good Practice requirements

## Complete

- Estimates are reported for all sources, sinks and gases
- National coverage

## Comparable

- Reporting should follow international guidance and templates

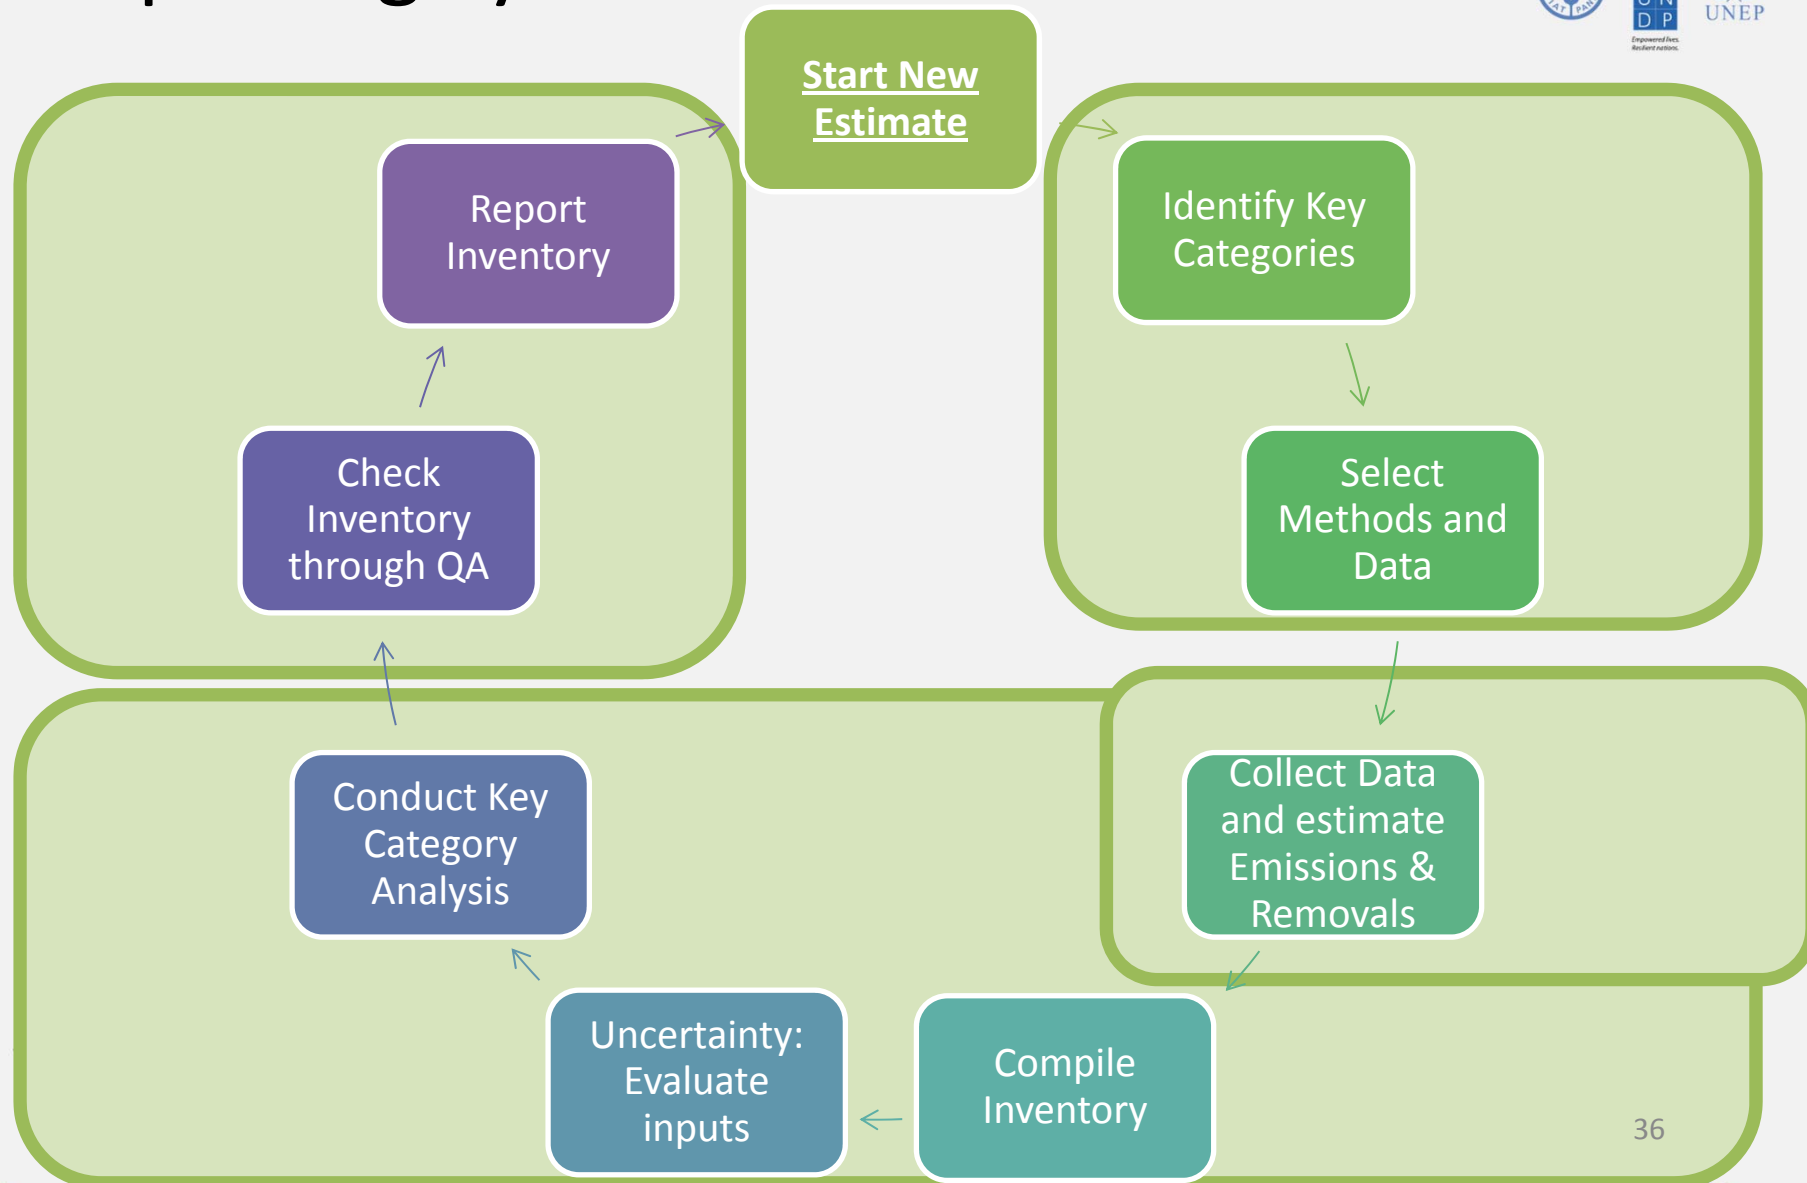

## Consistent

- Inventories should aim to reflect the real fluctuations in emissions and removals
- Not be subject to changes resulting from methodological differences

## Accurate

- GHG inventory contains neither under- nor over-estimates so far as can be judged
- Efforts have been made to reduce bias

# Reporting cycle for REDD+

# Reporting for REDD+ QA and QC

## Quality Control

- **Routine and consistent checks** to ensure data integrity, correctness and completeness
- **Identify and address errors** and omissions
- **Document and archive** inventory material and record all QA activities

## Quality Assurance

- Reviews, **preferably by independent third parties**, should be performed upon a finalized inventory following the implementation of QC procedures

# Reporting for REDD+

## REPORTING

Consistent with IPCC guidance and guidelines

Data and information are transparent

Consistency with FREL/FRL

Results reported through Biennial Update Reports

When seeking results-based payments (technical annex)

Expressed in tonnes of CO<sub>2</sub>eq per year

---

# Reporting for REDD+: Biennial Update Reports (BURs)

UN-REDD  
PROGRAMME

- To provide an update on the most recently submitted national communication in the following areas:
  - National circumstances and institutional arrangements
  - National GHG inventory
  - Mitigation actions and their effects, including methodologies
  - Constraints and gaps and related financial, technical and capacity needs
  - Level of support received to prepare and submit the BUR
  - Domestic measurement, reporting and verification
- **REDD+ results to be reported through a technical annex to BUR**
- No specific structure yet (templates being prepared by GIZ)
- Non-Annex 1 countries requested to submit by December 2014

National Forest Monitoring Systems for REDD+

# MRV FOR REDD+: VERIFICATION

# What is Verification for REDD+?

## VERIFICATION

2 LULUCF experts assess the technical annex of the BUR through *International Consultation and Analysis* (ICA) process

LULUCF experts develop a technical report reflecting the assessment of the annex

Technical report includes analysis of the results in the annex and areas identified for improvement

Technical assessment includes possibility of interaction with country for clarifications

Final report by the LULUCF experts to be published on the UNFCCC REDD+ web platform, including comments from the country

National Forest Monitoring Systems for REDD+

# FOREST MONITORING FOR REDD+

# Two functions of a National Forest Monitoring System for REDD+

# Forest Monitoring for REDD+

- Purpose of monitoring for REDD+: To **assess whether REDD+ activities are working**
- **Phased implementation** of monitoring for REDD+
  - **Phase 1**: Getting ready for REDD+, data, systems and capacity development
  - **Phase 2**: Monitoring of REDD+ **demonstration activities**
  - **Phase 3**: **National monitoring** of REDD+ policies and measures
- Combination of tools to gather a range of data/information
  - **Satellite remote sensing**: **Cost-effective to large area coverage**
  - **Web-GIS portal**: To **share data transparently**
  - **Community monitoring**: Bottom-up **validation of satellite data**, incorporation of **local knowledge** into national monitoring
  - **Other forest monitoring systems**: **Build on existing systems** (e.g. systems to monitoring logging concessions or protected areas)

## Web-GIS Portals

- Allows a country to **monitor the outcomes of the implementation of its REDD+** policies and measures and **communicate the results** to the international community (transparent and open reporting process)
- Allows any user to interact with the system through a user-friendly **web-interface**
  - Visualise data
  - Manipulate data layers, e.g. to select areas and layers of interest
  - Download statistics
  - Visualise information on logging concessions, protected areas, REDD+ activities, etc.
- Allows users to provide **feedback**, e.g. on areas of deforestation

National Forest Monitoring Systems for REDD+

# LINKING NFMS, MRV & IPCC

# Linking NFMS, MRV and IPCC

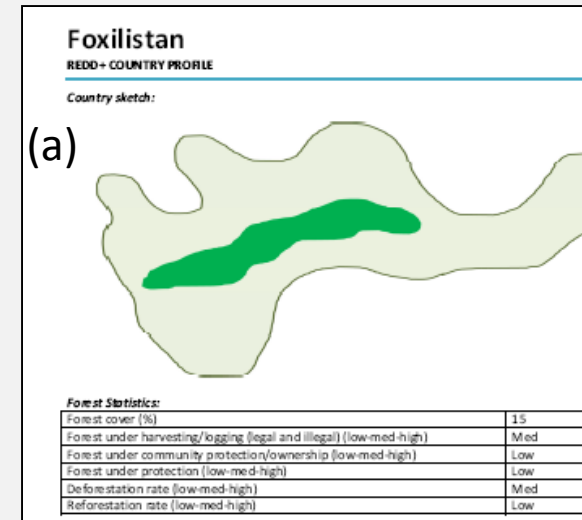

## Summary of NFMS and MRV

- Main components of a National Forest Monitoring System for REDD+ include a Satellite Land Monitoring System and a National Forest Inventory
- Key principles of IPCC's guidance for measurement, reporting and verification (MRV) for REDD+
  - Transparent, Documented, Consistent over time, Complete, Comparable, Assessed for uncertainties
- What's involved in MRV for REDD+
  - Measurement: Activity data x Emission Factors = Emissions
  - Report through NC and BUR on GHG emissions tonnes CO2 eq.
  - Verification – preferably by 3<sup>rd</sup> party reviewers
- Countries can design their own systems

# Introduction to exercise 2 on NFMS – 30 minutes please

- Break into 9 groups and examine 1 of the 9 fictional countries (a) for your group number
- Examine the guidance document (b) and discuss among the group the different questions
- During the discussion designate a note-taker to compile your discussion points and decisions
- At the end of the exercise consider your priority actions and reflect among the group
- If you need any guidance on the exercise please ask a facilitator
- Enjoy!

(b) REDD+ Academy  
NFMS Module  
Group Exercise: Designing Monitoring Protocol  
Guidance document

Split into nine groups and take one country profile per group.

You are a group of REDD+ policy makers for your country.

The objective of this exercise is to design nationally-appropriate REDD+ monitoring protocols for your country.

1. Familiarise yourselves with your country.

- What makes it unique?
- What characteristics will be important for REDD+ implementation?
