

UN-REDD | REDD+ ACADEMY
PROGRAMME

5

National Forest Monitoring Systems

Learning objectives

By the end of this module, you should be able to:

- Define what is a National Forest Monitoring System
- Describe the Monitoring and MRV functions of the NFMS
- Understand the concepts of Activity Data and Emission Factors

Agenda for the session

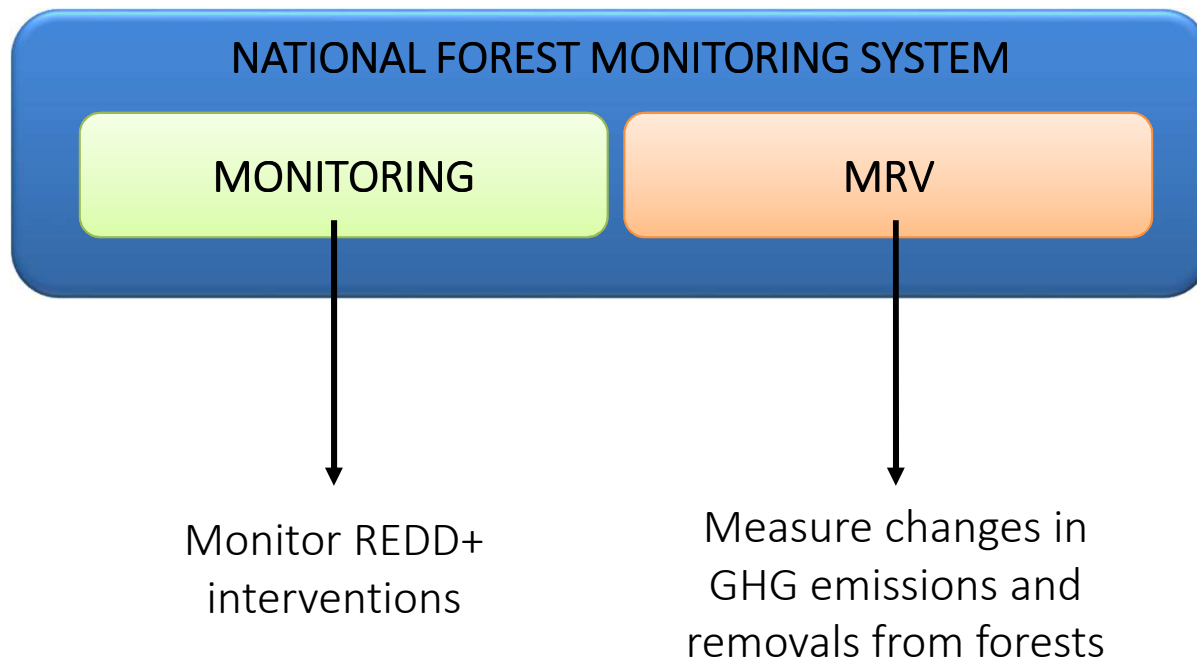

- Presentation of key aspects of an NFMS
- Q&A
- Group exercise

The NFMS...

- 1 of the 4 elements required by the UNFCCC
- Measures the **climate change mitigation impact** of REDD+ interventions
- Is closely related to the Forest Reference Emission Level(s)
- Can serve other purposes outside REDD+

What is an NFMS?

What is MRV?

- Measurement, Reporting and Verification
- A process to **estimate GHG (reduced) emissions and (enhanced) removals** resulting from the implementation of REDD+ activities

How does it work?

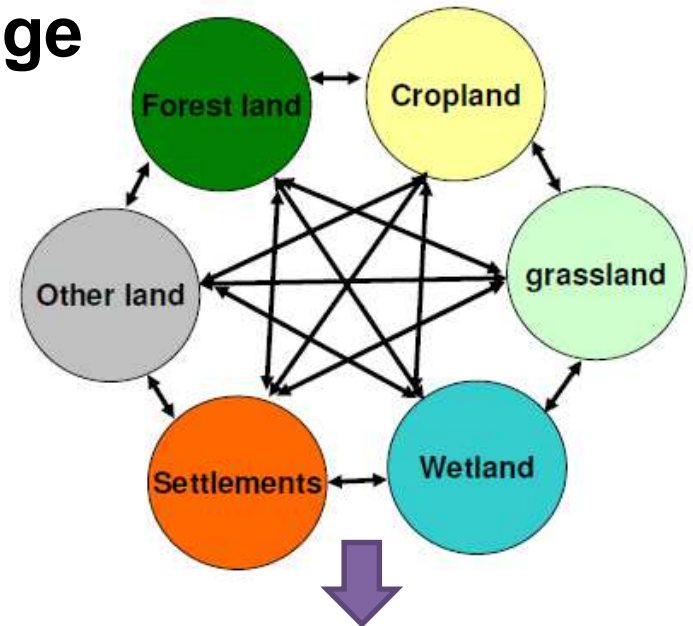

- There are international guidelines for estimating **human** GHG emissions and removals
 - Published by the **Intergovernmental Panel on Climate Change** (IPCC)
- Separate guidelines for different sources and sinks across a country, e.g.:
 - From transport, power stations, waste, agriculture and forestry

Activity Data: Area and Area Change

- Activity Data (AD) tells you:
 - How much land use change has taken place
 - What specific land use changes have taken place

How does it work?

- All land falls into one of 6 land use categories
 - Forest land, Cropland, Grassland, Wetland, Settlement, Other Land
- Use remote sensing / GIS to classify land
- Do this at two periods in time to calculate changes, e.g.
 - How much forest land in 2005 was still forest land in 2015?
 - How much forest land in 2005 was converted to cropland by 2015?

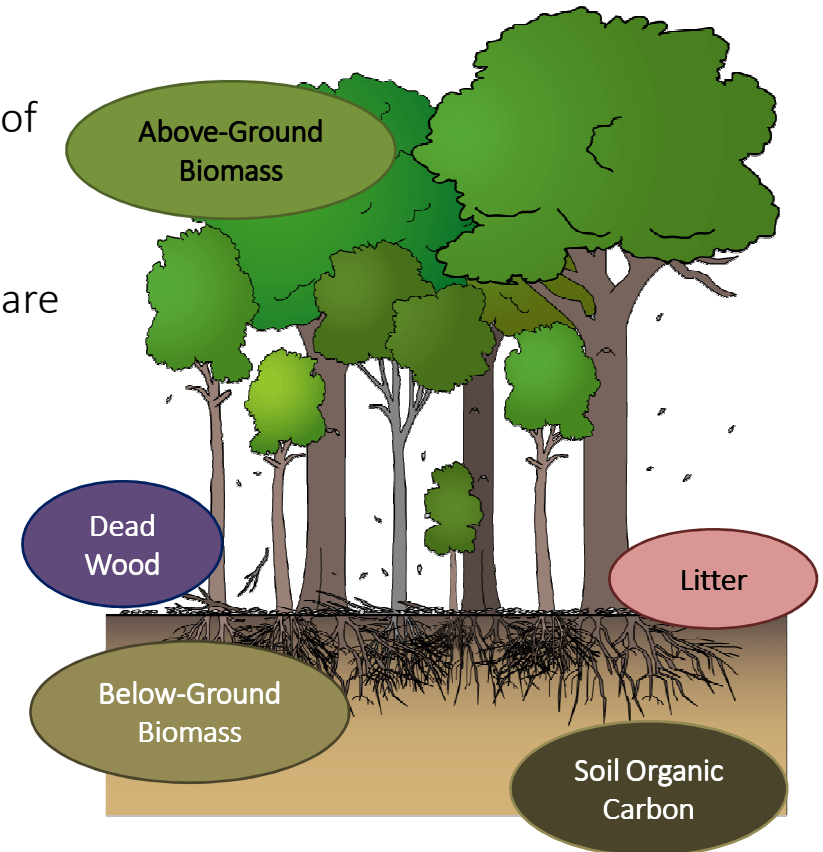

| | | Time 2 | | | | | |
|--------|------------|--------|-------|-----|---------|-------|--------|
| | | Crop | Grass | Wet | Settlen | Other | Forest |
| Time 1 | Crop | | | | | | |
| | Grass | | | | | | |
| | Wet | | | | | | |
| | Settlement | | | | | | |
| | Other | | | | | | |
| | Forest | | | | | | |

Emission Factors: Carbon Stocks & Changes

- Emission Factors (EF) tell you:
 - How much carbon was released from a hectare of human activity, e.g. forest land → cropland
- Removal Factors (RF) tell you:
 - How much carbon was sequestered from a hectare of human activity, e.g. cropland → forest land

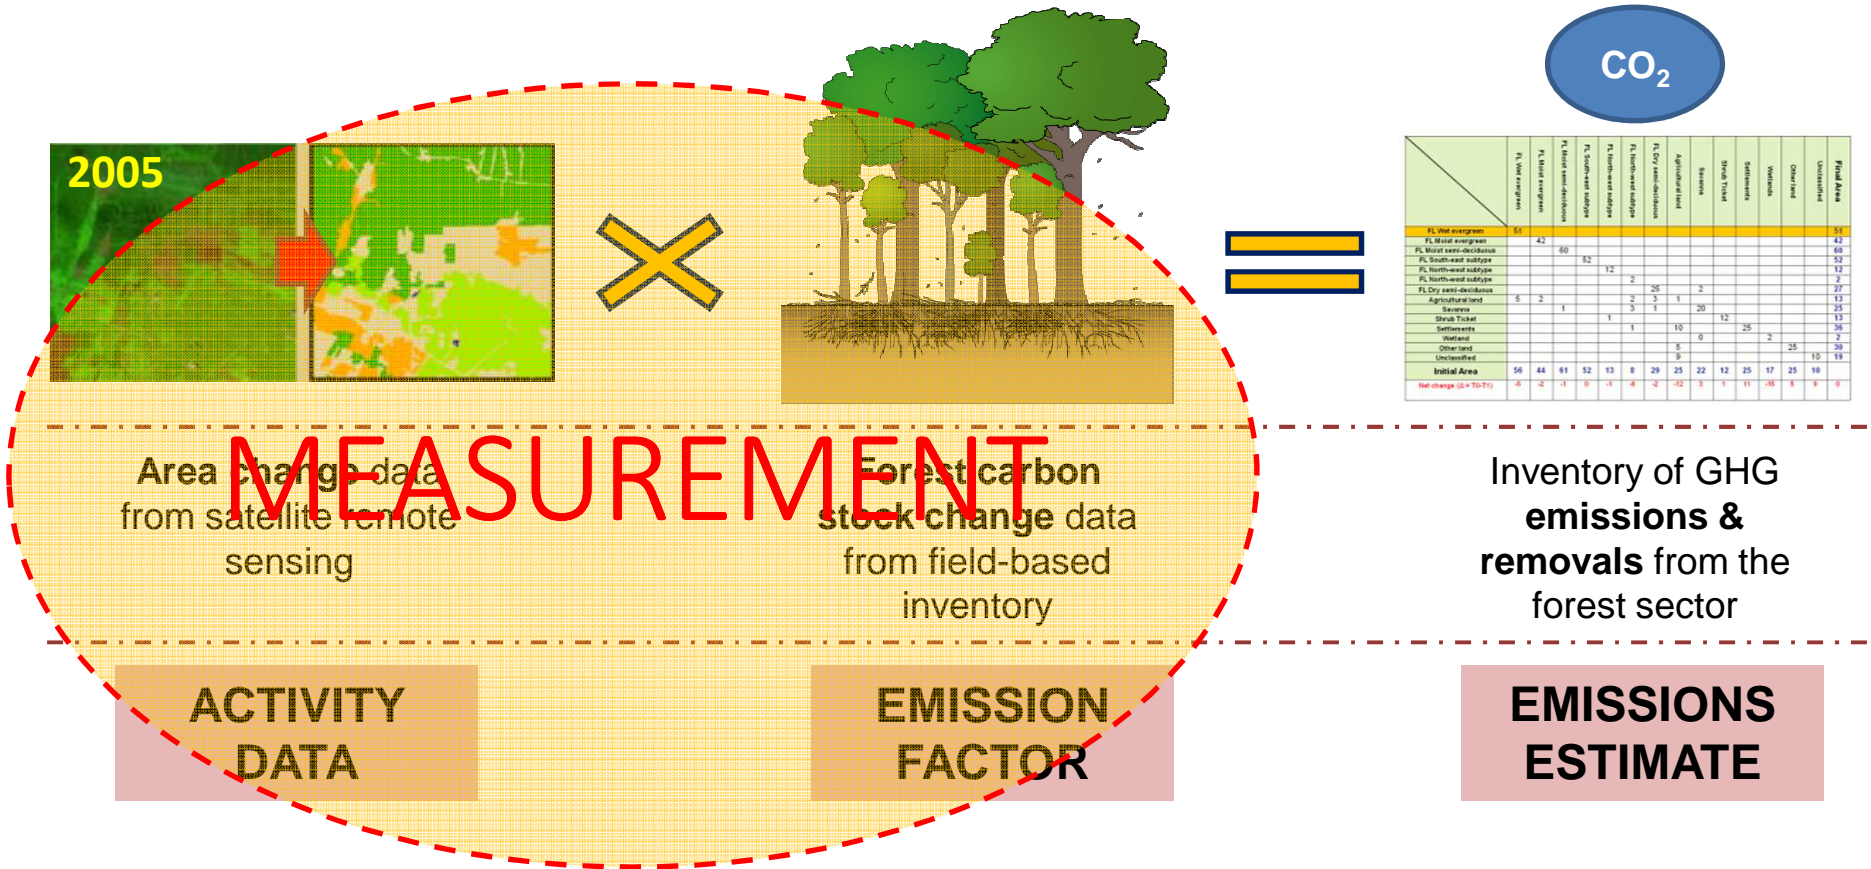

How does it work?

- Calculate the carbon stock in each land use category
 - Five carbon pools for forest land
 - Tools: ground-based inventories and research
- Apply appropriate EF or RF to each unit of AD
- IPCC provide “default” EFs and RFs

MRV for REDD+

IPCC Equation for Estimating Emissions & Removals

CO₂

| | F ₁ , Wet evergreen | F ₁ , Moist evergreen | F ₁ , Moist semi-deciduous | F ₁ , South-west subtype | F ₁ , North-west subtype | F ₁ , North-east subtype | F ₁ , Dry semi-deciduous | Agricultural land | Settlements | Other land | Initial Area | Final Area |
|---------------------------------------|--------------------------------|----------------------------------|---------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------|-------------|------------|--------------|------------|
| F ₁ , Wet evergreen | 51 | | | | | | | | | | | 51 |
| F ₁ , Moist evergreen | | 42 | | | | | | | | | | 42 |
| F ₁ , Moist semi-deciduous | | | 60 | | | | | | | | | 60 |
| F ₁ , South-west subtype | | | | 52 | | | | | | | | 52 |
| F ₁ , North-west subtype | | | | | 12 | | | | | | | 12 |
| F ₁ , North-east subtype | | | | | | 2 | | | | | | 2 |
| F ₁ , Dry semi-deciduous | | | | | | | 26 | | | | | 26 |
| Agricultural land | | | | | | | | 5 | | | | 5 |
| Settlements | | | | | | | | | 1 | | | 1 |
| Other land | | | | | | | | | | 20 | | 20 |
| Initial Area | | | | | | | | | | | 10 | 19 |
| Net change (L + T ₁) | | | | | | | | | | | 10 | 19 |

Inventory of GHG emissions & removals from the forest sector

EMISSIONS ESTIMATE

National Forest Monitoring Systems

Reporting for REDD+

- Countries will report REDD+ mitigation results to access REDD+ results-based finance
- Two channels for countries to report to the UNFCCC on REDD+:
 - National Communications
 - Biennial Update Reports (BUR)
- REDD+ results will be reported in a technical annex to the BUR
- REDD+ information will be posted on the UNFCCC REDD+ Web Platform
- Bhutan should appoint an official national REDD+ focal point to the UNFCCC

Table of Contents

| | |
|---|----|
| 1. Introduction | 33 |
| 2. Summary of information from the FREL for reducing emissions from deforestation in the Amazon biome | 34 |
| 3. Results in tonnes of CO ₂ eq per year, consistent with the assessed FREL for the Amazon biome | 38 |
| 4. Demonstration that the methodologies used to produce the results are consistent with those used to establish the assessed FREL..... | 39 |
| 5. A description of national forest monitoring systems and the institutional roles and responsibilities for measuring, reporting and verifying the results: | 40 |
| 5.1. The Amazon Gross Deforestation Monitoring Project – PRODES..... | 40 |
| 5.2. Roles and responsibilities for measuring, reporting and verifying (MRVing) the results..... | 49 |
| 6. Necessary information that allows for the reconstruction of results ... | 50 |
| 7. A description of how the elements contained in Decision 4/ CP.15, paragraph 1(c) and (d), have been taken into account | 51 |
| 7.1. Use of the most recent IPCC guidance and guidelines..... | 51 |
| 7.2. Establish, according to national circumstances and capabilities, robust and transparent national forest monitoring systems | 52 |

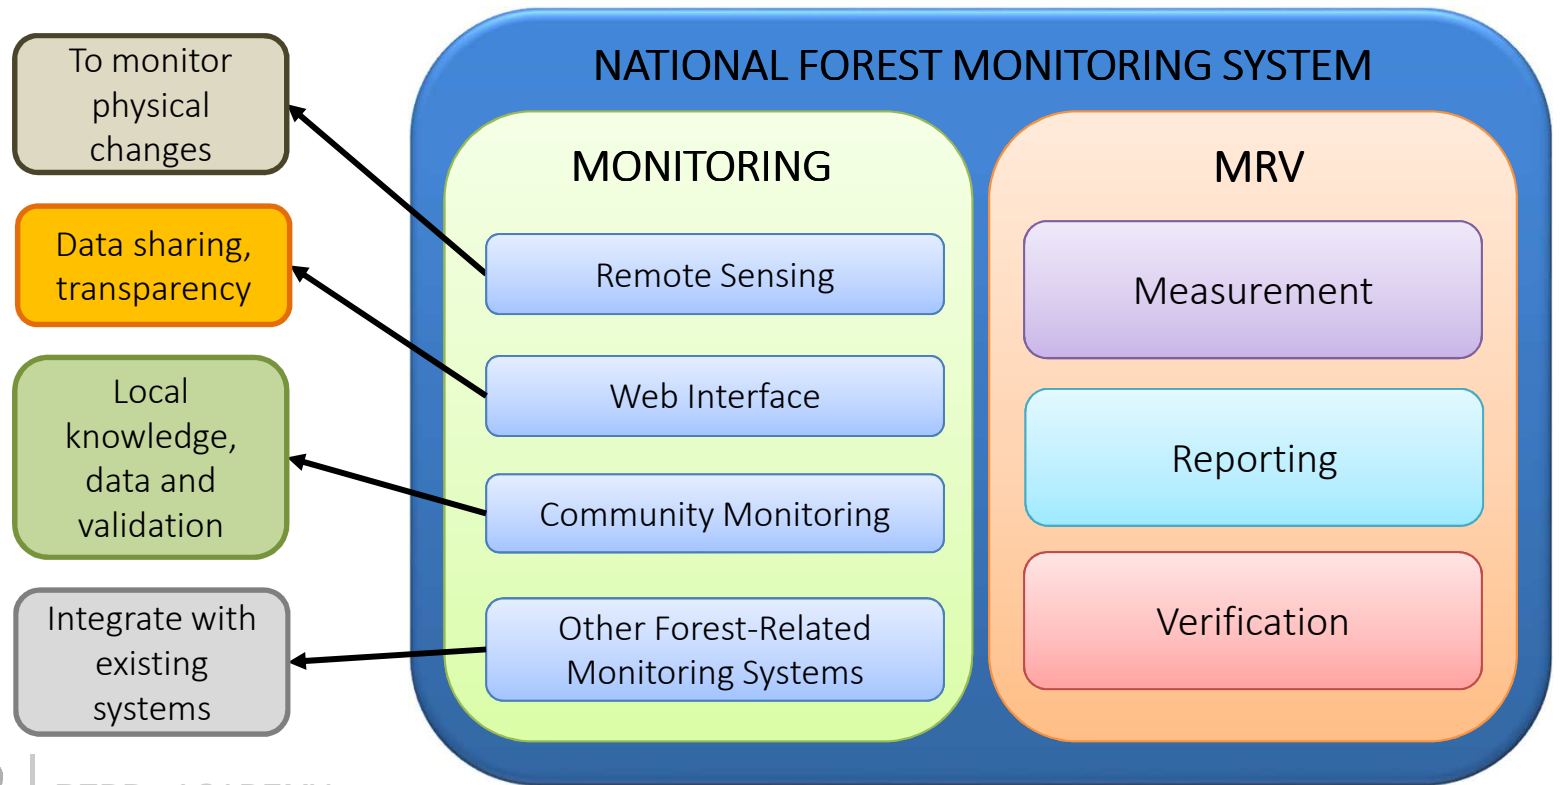

Verification for REDD+

MRV Overview

Forest Monitoring for REDD+

Key points

- National Forest Monitoring Systems have two functions
 - MRV
 - Monitoring for REDD+
- MRV is a process to estimate GHG emissions and removals
- Activity Data and Emission Factors are key data for MRV
- Forest monitoring for REDD+ can help assess whether interventions are working
