## I. PREFACE

### 1.1 Background

Due to reduce the emission from deforestation and forest degradation, international approach are needed which can bridge economy development and local community livelihood. It will stipulate the Developing countries to reduce the emission from deforestation and forest degradation if the incentives in line with the opportunity cost from the landuse activity.

Various international meeting on climate change has been made in various countries. In mid-December 2010, an international convention held specifically on climate change, COP (Conference of the Parties) 16, in Cancun, Mexico. Agreement Cancun (Cancun Agreement) are considered successfully renewed confidence in many people to return to work together in addressing climate change. Cancun Agreements managed to provide a framework for a critical component in efforts to tackle climate change, one of which is the REDD + (Reducing Emissions from Deforestation and Forest Degradation, forest carbon stock enhancement and conservation). Cancun Agreements provide a strong framework for the inclusion of tropical rainforest in the main agenda of handling climate change, through REDD +, adaptation, conservation and enhancement of forest carbon stocks and sustainable forest management. In addition, the Cancun Agreements scheme is a "recognition" of the active contribution of developing countries in climate change mitigation efforts.

REDD + has significance for Indonesia because Indonesia has the third largest area of tropical rainforest in the world. In addition, the call to exchange experiences from activities aimed at reducing emissions from deforestation and the destruction of tropical forests, was first formally stated in the "Bali Action Plan" produced at the UNFCCC COP-13, held in Bali in 2007 . Therefore, the Indonesian government has made a commitment to reduce greenhouse gas emissions (GHG) by 26% with domestic funding and 41% with the help of the international in 2020 from the level of emissions BAU (Business As Usual / Building without Emission Reductions) .

In order to realize this commitment, on May 26, 2010 the Government of Indonesia has signed a memorandum of agreement (Letter of Intent or LOI) with the Government of the Kingdom of Norway to make efforts to reduce greenhouse gas emissions from deforestation and forest degradation and peatland conversion. Since the signing of the LoI, the Government of Indonesia has made progress in the implementation of REDD + preparations, one of which is the presence of the UN-REDD Programme. UN-REDD Programme is a national program of co-operation between the Ministry of Forestry with UN-Agencies (FAO, UNDP and UNEP). The purpose of the UN-REDD Programme is to assist the Government of Indonesia to be ready to welcome the implementation of REDD + mechanism at the end of 2012. Provincial Election pilot conducted by UN-REDD based kriteri-established criteria.

In March 2010 the Inception Workshop was held by UN-REDD Indonesia Program in Jakarta. Based on the presentation of the Forest Region of Central Sulawesi province, review the potential of Central Sulawesi based selection criteria Provincial pilot by UN-REDD and input from stakeholders, the workshop decided that the province of Central Sulawesi was selected as Demonstration Activity REDD+, which in turn established by the Secretary-General of the Ministry of Forestry Number: 5.786/II-KLN/2010 dated July 26, 2010.

Due to preparation and implementation of REDD+ mechanisms, data and information are required to identify carbon stocks for each type of land cover, emissions and carbon sequestration which caused from each land cover changes (degradation or deforestation), including the socio-economic conditions of society.

## **1.2 Objective**

Preparation of carbon forestry statistics book aims to document data and information on carbon storage, carbon sequestration, and carbon emissions caused by deforestation and degradation. The document is expected to be a source of data and information in the implementation of REDD + mechanisms both at national and local level in the province of Central Sulawesi.

## **1.3 Deliverable**

Preparation of documents Stats of Forest Carbon Central Sulawesi is intended for stakeholders at the international, national, and local (Central Sulawesi) involved in the implementation of REDD +

## **1.4 Scope**

The scope of the preparation of the Forest Carbon Stats Central Sulawesi is the presentation of data and information relating directly or indirectly to the implementation of REDD +.

## **1.5 Definition**

Definition used in the preparation of the Forest Carbon Stats of Central Sulawesi:

BPS : Statistic Center Bureau

Forest degradation : Decline in tree density and / or increasing damage to forests caused loss of forest products and other ecological services from forests.

Deforestation	: logging and conversion of forest cover land permanently for a variety of other benefits.
HPH	: Permit issued for selective logging in natural forests for a certain period, typically 20 years, and renewed for a further period, generally 20 years.
Conservation Forest	: Forests that are designed for the protection of wildlife or their habitat, usually located in national parks and other protected areas.
Convertible Forest	: Forests are designed for clearance and permanent conversion into other forms of land use, especially timber industrial or plantation.
Protection Forest	: Forests are intended to carry out the functions of the environment, in particular to maintain vegetation cover and soil stability on steep slopes and protect watersheds.
Limited Production Forest:	Forests allocated for timber production with low intensity. Limited production forest is generally located in the mountainous region where steep slopes complicate to logging operation.
Production Forest	: Forests are located within the boundaries of the concession (HPH licensed) and managed to produce timber.
Carbon dioksida (CO <sub>2</sub> )	: Gases in the atmosphere, produced as a byproduct of combustion. Carbon dioxide can also be released when the activities of land use/land cover conversion and industrial activities.
Estate Crop	: Crops grown on the farm. Kind, including rubber, oil palm, coconut, cocoa, and tea.
REDD-plus	: REDD framework broader include forest conservation, sustainable forest management or enhancement of carbon stocks in order to implement REDD participation of the wider community and to reward countries that are trying to protect their forests.
Carbon Sequestration	: The process of binding of CO <sub>2</sub> in the atmosphere by plants through photosynthesis then store it in the form of biomass in different parts of the plant.
Carbon stock	: Media or point of carbon sequestration and storage in the form of organic matter, forest vegetation, sea and land.

## **II. METHODOLOGY**

---

## II METHODOLOGY

### 2.1 Data and Sources

Data used in the preparation of carbon forestry statistics of Central Sulawesi Province include:

- Spatial Data of Appointment forests and waters, Director General of Planning Ministry of Forestry.
- Spatial data of land cover and land use, Director General of Planning Ministry of Forestry.
- Administrative area Spatial Data of Central Sulawesi, BAPPEDA of Central Sulawesi
- Plantation Spatial data, Plantation Office of Central Sulawesi Province
- Mining Spatial data, the Department of Mines of Central Sulawesi Province
- Watershed, Spatial Data BPDAS Central Sulawesi province
- Topographic Spatial Data, SRTM-USGS
- Carbon Stock Data / emission factors, DG Planning Ministry
- Geography, population, and administration Data, Bureau Statistic of Central Sulawesi Province

### 2.2 Methode

Carbon storage value is determined by the type of land cover. To determine the total carbon storage is an accumulation of carbon deposits on the value of each type of land cover per unit area (tons C / ha) multiplied by luasanya. As for determining the absorption or emission of carbon is influenced by any changes in land cover. Carbon emissions are determined by changes in carbon stocks due to deforestation and degradation or to the use and non-forest land cover. Carbon emissions is the difference between carbon storage in forest conditions in the area of carbon deposits on non-forest land cover conditions, which the non-forest land cover is terjadi as a result of deforestation or forest degradation. In contrast to carbon absorption is the addition of carbon stocks as a result of the addition/vegetation growth. In the preparation of this carbon sequestration statistics is the value of the increase in carbon in non-forest land cover and forest or vacant land into vegetated land.

Determination of the land cover and the land use widespread distribution distribution of carbon stocks, distribution of carbon sequestration dan emission, and spatial analysis done through a process of spatial data overlay administrative area central Sulawesi province.

# **III. GEOGRAPHICAL CONDITIONS**

### III. GEOGRAPHICAL CONDITION

#### 3.1 Area and Geographical Possition

Central Sulawesi is located in Central of Sulawesi island, with total terrain area 61,230 km<sup>2</sup> or ca. 36.47% of Sulawesi island (spasial data of Central Sulawesi, Planning and Development Agency Of Central Sulawesi). Area of Central Sulawesi waters reached 193,923.75 km<sup>2</sup> by 1140 as the number of islands with boundaries as follows:

- Northern boundaries : Sulawesi Sea and province of Gorontalo
- Eastern boundaries : Maluku and North Maluku
- Southern South boundaries : Sulawesi province and Southeast Sulawesi province
- Western boundaries : Makassar Strait and West Sulawesi province.

Based on geographic, Central Sulawesi located between 2°22' north latitude and 3°48' south latitude, 119°22' and 124°22' east longitude. Central Sulawesi geostrategic position in the middle of the archipelago and in the middle of the island of Sulawesi, the waters were on the track corridor from north to south towards the ocean pacific (Makassar Strait and Sulwesi Sea).

#### 3.2 Topography

Based on landslope (Central Sulwesi Statistic Central Berau 2011), Central Sulawesi highlands are detailed as follows:

- slope 0–3° = 11.8 %
- slope 3–15° = 8.9 %
- slope 15–40° = 19.9 %
- slope over 40° = 59.9 %

Meanwhile, based on elevation (high of sea surface), land in Sulawesi Tengah Province consists of:

- 0 m - 100 m = 20.2 %
- 101 m - 500 m = 27.2 %
- 501 m - 1000 m = 26.7 %
- 1,001 m and over = 25.9 %

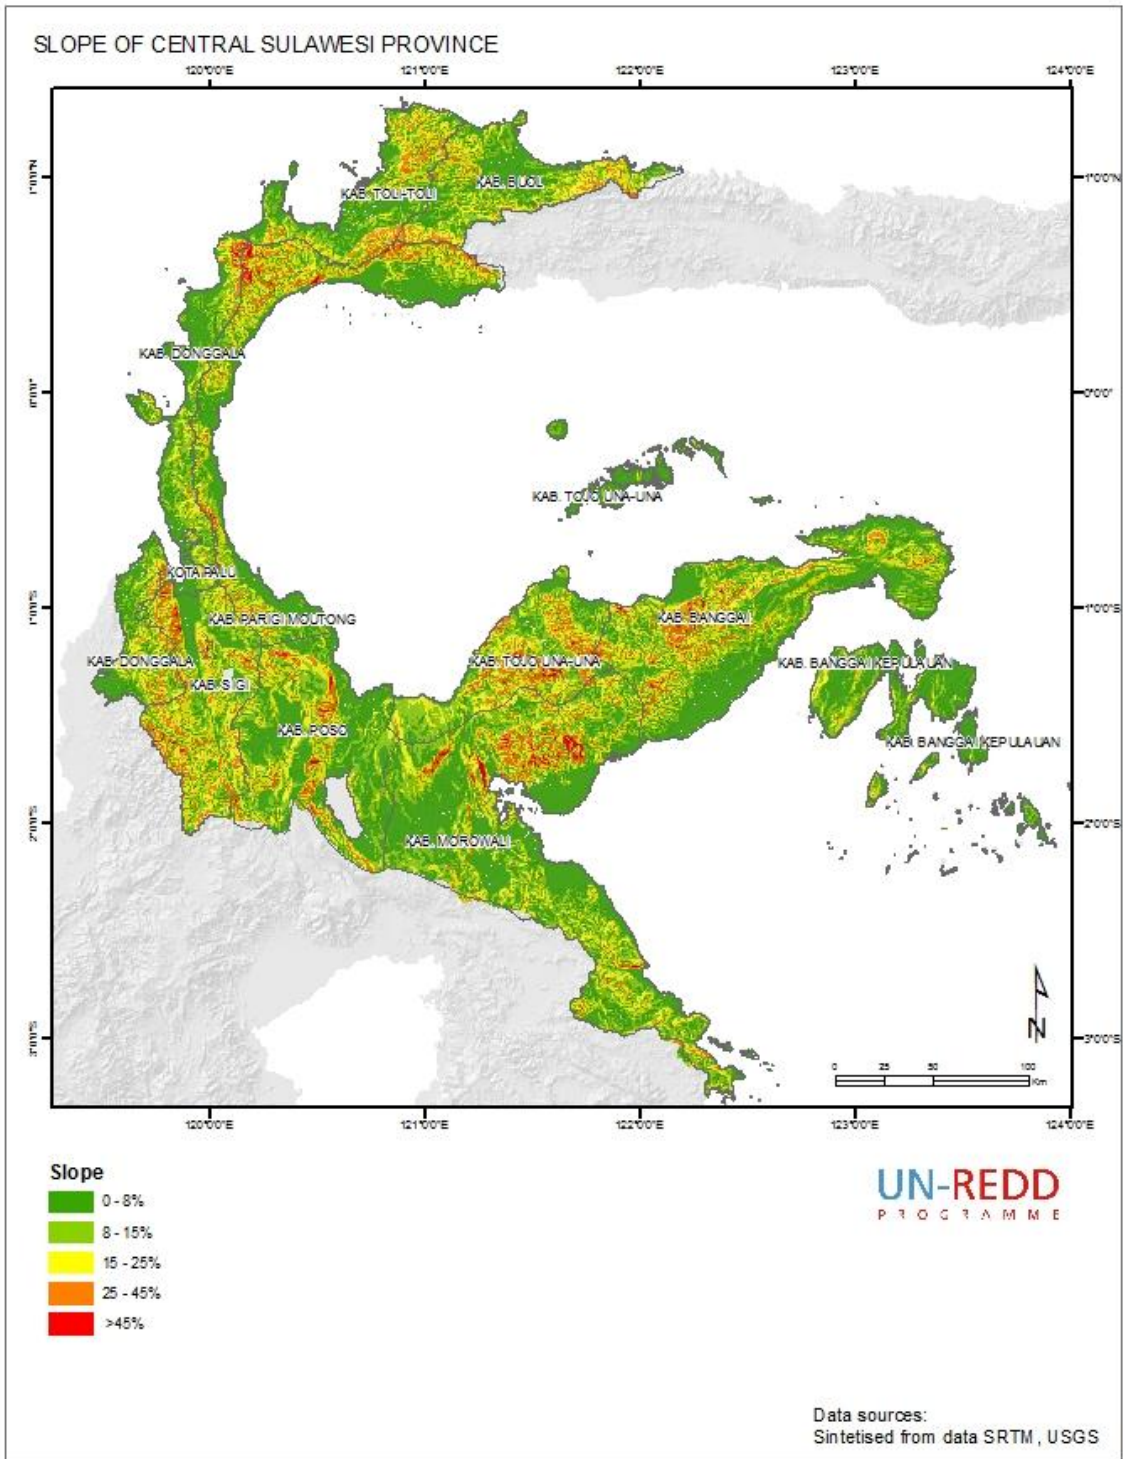

Figure 3.1 Slope Map of Central Sulawesi

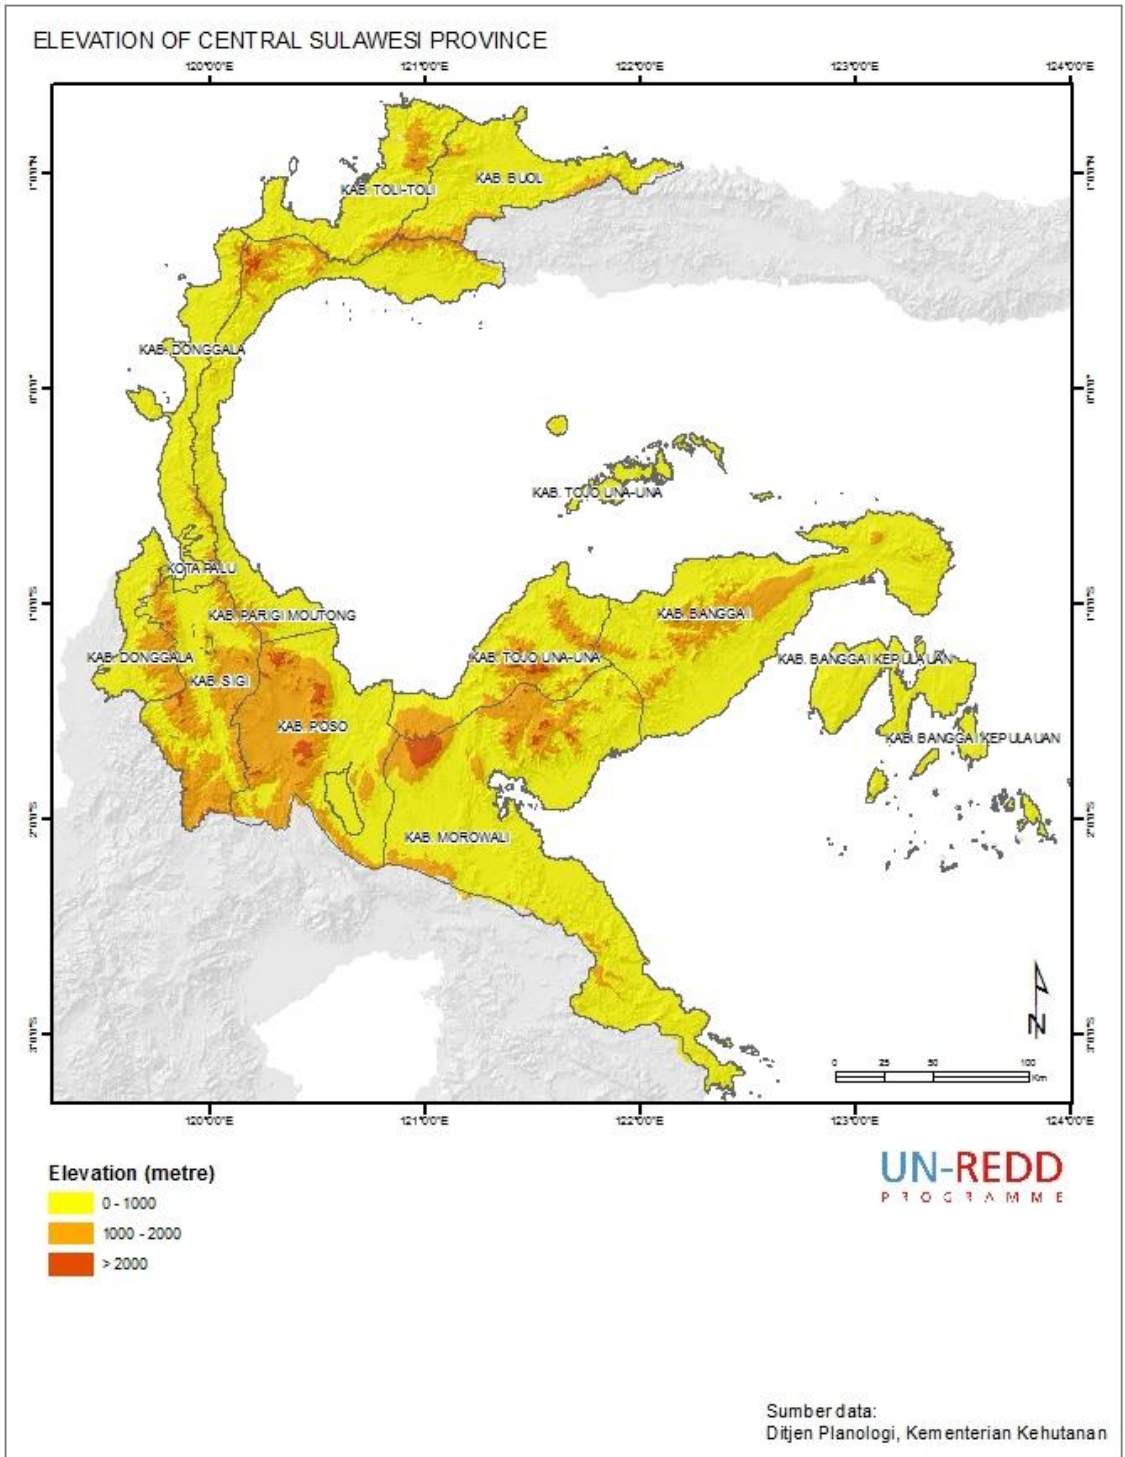

Figure 3.2 Elevation Map of Central Sulawesi

### 3.3 Geology

Structure and geological characteristics of Central Sulawesi region is dominated by mountain ranges and plateaus, ranging from the Buol and Tolitoli, there are mountain ranges up into the mountains in the province of North Sulawesi. In Donggala and there Moutong Parigi isthmus flanked by the Makassar Strait and the Gulf Tomini, but it is mostly a mountainous and hilly. In the south and east that includes the district of Poso, Tojo Unauna, Morowali and Banggai, there is a very tight mountain ranges like Mountains Tokolekayu, Verbeek, Tineba, Pampangeo, Fennema, Balingara, and Batui. Most of the mountainous areas that have steep slopes with above 45 degrees (BPS Central Sulawesi 2011).

### 3.4 Hydrology

Along the Central Sulawesi there Watershed flowing in the district and city. In addition, to the watershed there are also several lakes that are almost entirely located in protected areas (BPS Sulteng 2011).

## **IV ADMINISTRATION**

## IV. ADMINISTRATION

### 4.1 Administration Area

The administration, to the 2011 of Central Sulawesi province consists of 10 districts and 1 town that Banggai, Banggai Islands, Buol, Donggala, Morowali, Parigi Moutong, Poso, Sigi, Tojo Una-Una, Tolitoli, and Palu. The number of districts as many as 161 districts, with the number of Village and urban 166 and 1682 respectively (BPS Sulteng 2012).

## 4.2 Profile of Forestry Service of Central Sulawesi

Forestry Service of Central Sulawesi Province was established by Regulation Central Sulawesi No. 06 in 2008 on the Establishment of Organization and Administration of the Regional Bureaus of Central Sulawesi Province. Under the regulation, Forestry Service of Central Sulawesi province has the task of carrying out the affairs of the local government based on the principle of decentralization and de-concentration and forestry assistance. The main duties include coaching, supervision, and implementation of forestry development which includes Secretary, Planning, Business Development of Forest, Land Rehabilitation and Social Forestry and Forest Protection and Nature Conservation.

Development Goals formulated by the Forest Service analysis of current forest conditions as a starting point and guide the development of 5 (five) years in accordance with the functions and role of the Forest Service. Development Goals Regional Forestry Service of Central Sulawesi province in 2016 are:

- 1) Improve optimization of production forest management, increased orderly management of forest products, forest fees orderly, non-tax revenues (tax revenues) in forestry and industrial revitalization and primary timber;
- 2) Increased precondition of sustainable natural resource management in production forests and protected forests;
- 3) Increased functionality and support of production forests and protected forest so as to reduce the risk of natural disasters through community involvement around the forest;
- 4) Reduce forest disturbance and forest product in the administration as well as protection and optimize the management of Tahura Poboya-Paneki;
- 5) Increased implementation of the administrative order, accountability and transparency in planning, financial management, asset and civil servants management of Forest Service.

The goal of the I Forestry Service of Central Sulawesi in 2011-2016 are:

- 1) ncreased community participation through community-based forest management and forest health welfare;
- 2) Increased revenue contribution of forestry and forest products industry legally certified;
- 3) Increasing the number of forest management units at the site;
- 4) The maintenance of forest boundaries;
- 5) Sustainable forest management entity (KPH) Dampelas Tinombo;

- 6) Increased forest plantations in order to reduce the rate of forest degradation oriented welfare;
- 7) Decreased levels of forest disturbance and damage to forest areas of strategic;
- 8) Increasing public awareness / stakeholders to protect and preserve the natural resources and environment
- 9) Management of nature conservation area Tahura;
- 10) Realization of increasing the planning, oversight and accountability of the government

# V POPULATION

---

## V. POPULATION

### 5.1 Number and Growth Population

According to the population census in 2011 the population of Central Sulawesi reached 2.7 million people with an average growth of 1.85% in 1990-2011. The population density of 2016 people person per village.

Table 5.1 Number dan Growth Population of Central Sulawesi 1990–2011

Population Census	Sex		Total (persons)	Population Growth (%)
	Male	Female		
1990	877,039	834,288	1,711,327	
2000	1,113,212	1,062,781	2,175,993	2.52
2005	1,185,880	1,126,981	2,312,861	1.22
2010	1,350,844	1,284,165	2,635,009	1.95
2011	1,375,817	1,307,905	2,683,722	1.71

## 6.2 Forest Area

### a. Forest Function

Central Sulawesi forest areas are divided by function into production forest classified into permanent production forest, limited production forest, and forest conversion; protected forests and conservation forests covering the Natural Park and Reserve Forest area include Lore Lindu National Park. Area of production forests with the largest proportion of 35% of the total forest area, then use the other areas and protected areas with their respective proportion of 32% and 22% as shown in Table 6.1 and Figure 6.1.

Table 6.3 Forest area based on function in the region of Central Sulawesi

No.	Forest Function	Area (Ha)
1	Another area of use	1,944,642
2	Protection Forest	1,339,695
3	Production Forest	465,937
4	Conversion Forest	272,553
5	Limited Production Forest	1,418,043
6	Natural Park and Reserve Forest	397,827
7	Lore Lindu National Park	215,875
8	No data	58,795
<b>Total</b>		<b>6,113,368</b>
