## ecosystem valuation and under-valuation

12345

#### ecosystem values and human well-being

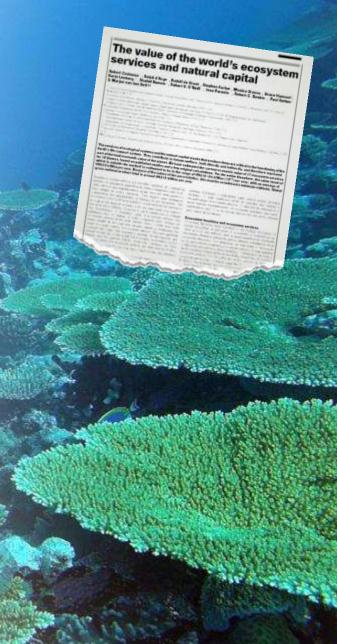

Millennium Ecosystem Assessment. 2005. Ecosystems and Human Well-being: Synthesis. Island Press, Washington DC.

# the value of the world's ecosystem services

	Area (million ha)	Value (\$ trillion/yr)
Open ocean	33,200	8.381
Coastal	3,102	12.568
Tropical forest	1,900	3.813
Temperate forest	2,955	0.894
Grass/rangelands	3,898	0.906
Tidal marsh/mangroves	165	1.648
Swamps/floodplains	165	3.231
Lakes/rivers	200	1.700
Cropland	1,400	0.128
Total	51,625	33.268

Costanza, R., d'Arge, R. de Groot, R. Farber, S., Grasso, M., Hannon, B., Limburg, K., Naeem, S., O'Neill, R.V., Paruelo, J., Raskin, R.G., Sutton, P. and M. van den Belt 1997. "The value of the world's ecosystem services and natural capital". Nature 387: 253-260.

## the costs of failing to halt terrestrial biodiversity loss

	Loss to 2050 (€ billion)	
Food, fibre, fuel	192	
Air quality maintenance	-2,019	
Soil quality maintenance	-1,856	
Climate regulation	-9,093	
Water regulation, purification & waste management	-782	
Cultural diversity, heritage, recreation	-303	
Total	-13,938	

L. Braat & P. ten Brink, (eds.) 2008. The Cost of Policy Inaction: The case of not meeting the 2010 biodiversity target. Alterra, Wageningen UR and Institute for European Environmental Policy, Brussels.

#### why under-valuation is a problem

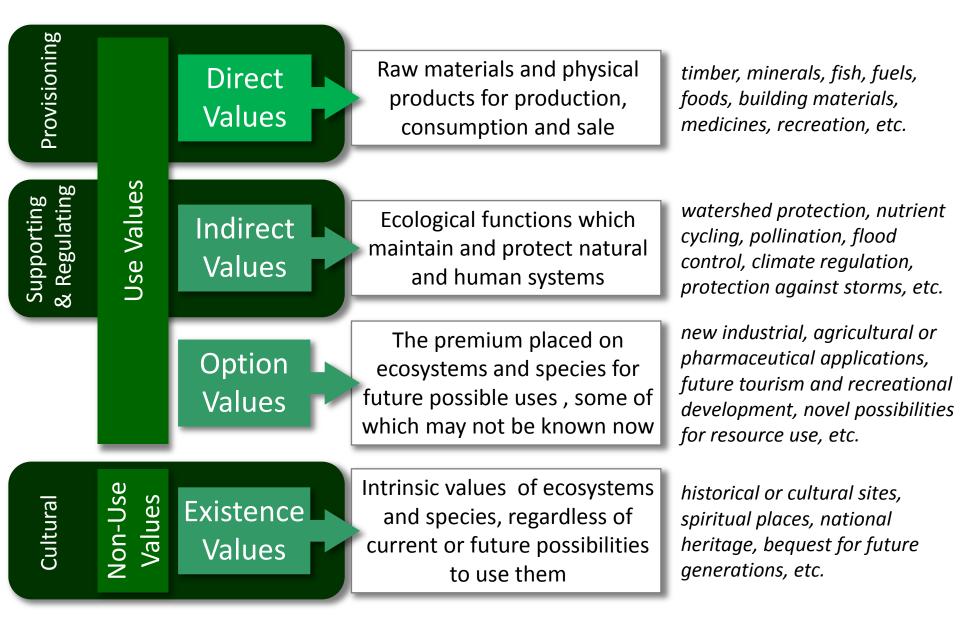

- traditionally, economists focus on the value of extractive or commercial land and resource uses
- this **ignores** some of the most important biodiversity and ecosystem values
- meaning that decisions are made based on incomplete, and flawed, information
- this results in missed economic opportunities and has incurred huge costs and losses to economic growth and development

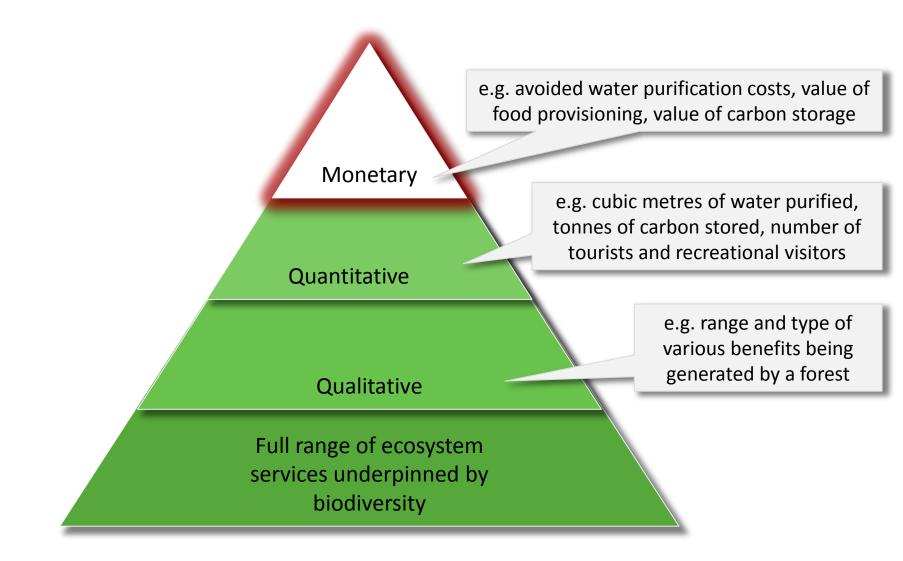

## total economic value

12345578

## Total Economic Value (TEV)

## different levels of ecosystem valuation

Adapted from: Gantioler S., Rayment M., Bassi S., Kettunen M., McConville A., Landgrebe R., Gerdes H. and P. ten Brink. 2010. Costs and Socio-Economic Benefits associated with the Natura 2000 Network. Final report to the European Commission, DG Environment

## ecosystem value distribution

- seeing who gains and who loses from a particular course of action
- calculating how much these net gains or losses are worth
- identifying where there are need or opportunities to reallocate or redistribute costs and benefits so as to encourage equitable and sustainable solutions

## TEEB

- Potsdam, March 2007: meeting of G8+5 Environment Ministers
- resulted in the "Potsdam Initiative" on biodiversity, including study to draw attention to the global economic benefits of biodiversity
- TEEB Phases I & II (2008-2010) built up evidence base and approach
- Phase III now rolling out national, regional and sector TEEBs

### **TEEB** steps

# **3.** CAPTURE the value of ecosystem services and seek SOLUTIONS

#### 1. IDENTIFY and ASSESS the

full range of ecosystem services and people affected

2. ESTIMATE and DEMONSTRATE the value of ecosystem services

TEEB. 2010. The Economics of Ecosystems and Biodiversity: Mainstreaming the Economics of Nature: A synthesis of the approach, conclusions and recommendations of TEEB

# using ecosystem valuation for decision-making

124EC

## how valuation is commonly used

- **justifying** the economic importance of nature to decision-makers
- identifying opportunities for "capturing" funding and income
- calculating prices, charges and fees for land and resource uses
- costing ecosystem damage, penalties and fines
- modifying national income and other economic/growth measures

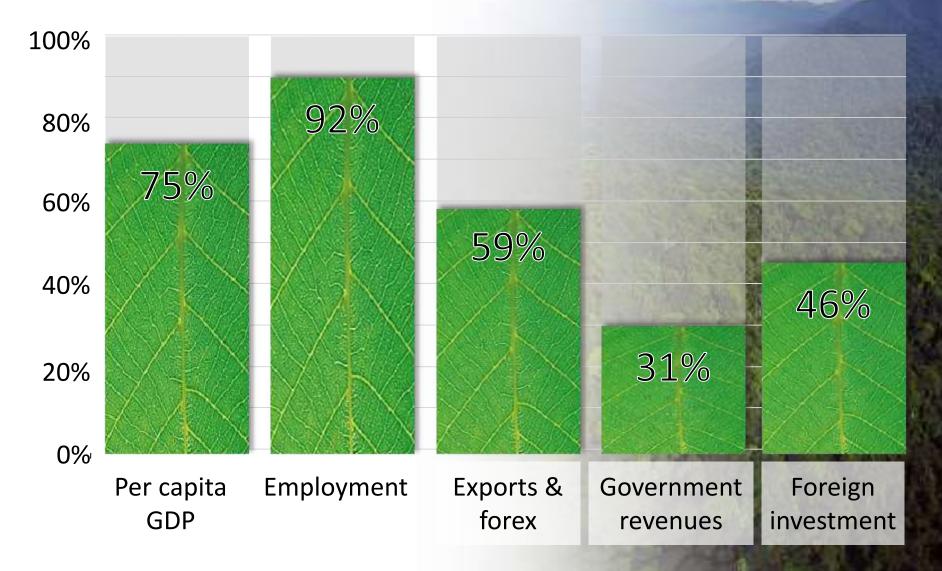

## demonstrating reforestation benefits in Croatia

16%

	Visible	Regional		Wood	Erosion	
County, site	landscape	landscape	Hunting	production	protection	<u>Total</u>
Lika-Senj						
Jasenje-Bisernjakovica	112,699	27,320	22,457	427	97,639	260,542

## justifying investments in biodiversity in Lao PDR

Emerton, L. 2005. Making the Economic Links Between Biodiversity and Poverty Reduction: The Case of Lao PDR,IUCN — The World Conservation Union, Ecosystems and Livelihoods Group Asia, Colombo

#### generating revenue in Finnish National Parks

National Parks currently financed directly from the government budget, and provided to citizens free of charge.

Valuation used to see whether there was the potential to introduce user fees, and how much people would be willing to pay.

Found that more than 70% of users would pay for a recreation pass, on average €8 each, potentially generating earnings of €32 million.

This exceeds the current budget for running the Parks of around €13 million.

Huhtala, A. 2004. What price recreation in Finland?—A contingent valuation study of non-market benefits of public outdoor recreation areas. Journal of Leisure Research

#### calculating oil spill liabilities in the USA

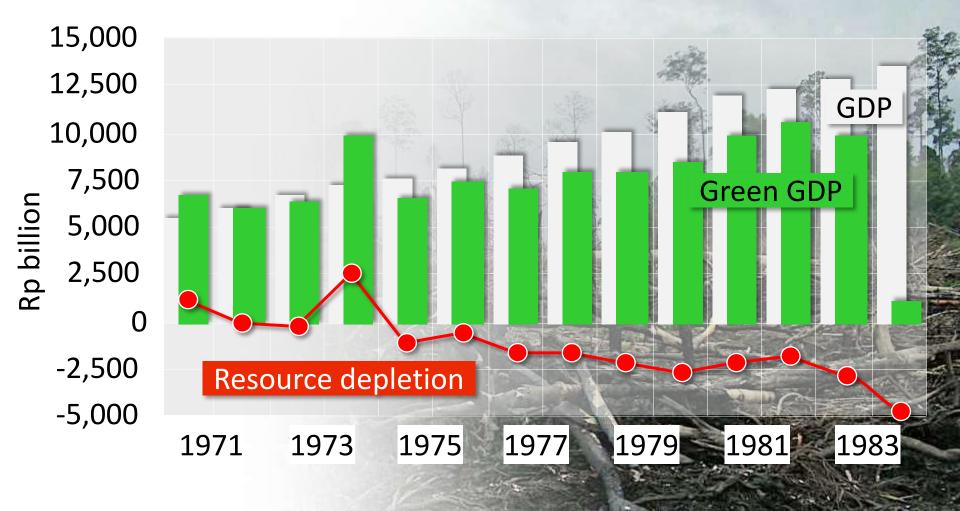

Pipeline rupture resulted in the oiling of salt marsh and mudflats, killing wetland vegetation and fauna.

Valuation used by NOAA and the oil company to calculate environmental losses and compensation amount. Based on interrupted or lost services in fishing and boating access, near-water recreation, and wetlands services.

Parties were thereby able to reach a negotiated settlement, and damages of just over US\$ 11 million were awarded.

Desvousges, W.H., Dunford, R.W. and K. E. Mathews. 1992. Natural Resource Damages Valuation: Arthur Kill Oil Spill. Paper presented at Association of Environmental and Resource Economists Workshop on Benefits Transfer: Procedures, Problems, and Research Needs, Utah

#### accounting for green national income in Indonesia

Repetto, R., McGrath, W., Wells, M., Beer, C. and F. Rossini. 1989. Wasting assets: natural resources in the National Income Accounts. World Resources Institute, Washington D.C.

ecosystem valuation methods

CASIO

123450

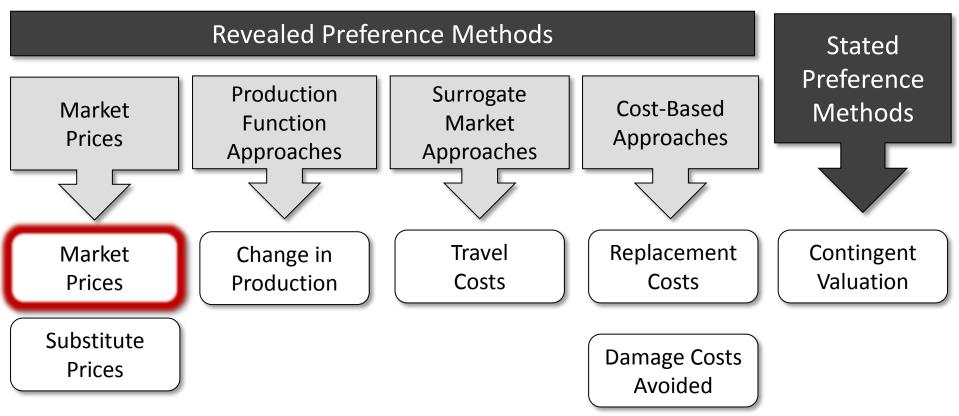

## how ecosystems are traditionally valued

- look at quantity of commodities that are consumed, bought or sold
- apply **market price** to calculate the value of the good or service
- … however … many ecosystem services have no market or price
- ... so ... using market price techniques would ignore many of these values
- ... additional methods must be used

## ecosystem valuation methods

asking directly

observing people's behaviour to impute their values

#### substitute prices

Used to value non-marketed wild edible plants along Thai-Myanmar border.

Found prices in local markets for similar or identical products to those collected, and applied these to wildharvested fruits, leaves, stems, flowers, roots and medicines.

Showed that total value of non-timber forest products worth around US\$ 300 per household per year.

Delang, C.O. 2005. Economic valuation of non-marketed wild edible plants in Thailand. Environmental Conservation 32(4): 285-287.

#### change in production

Used to value the soil conservation benefits of agroforestry in the Eastern Visayas in the Philippines.

Use production function to link soil quality to agricultural yields and profits.

Analysis of share of profits associated with change in soil quality showed that investments in agroforestry can increase annual agricultural profits by 6%, or US\$ 53/household/year.

Pattanayak, S. and D. Mercer. 1998. Valuing soil conservation benefits of agroforestry: contour hedgerows in the Eastern Visayas, Philippines. Agricultural Economics 18: 31-46.

#### travel costs

Applied to five Romanian National Parks. Involved 325 questionnaires to visitors.

Asked about distance travelled, frequency of visits, costs involved and socio-economic characteristics (age, education, preferences, etc.).

Found consumer surplus of €42. Generally higher for tourists who traveled longer distances and for older people. Higher income earners less interested in PAs than other types of tourism.

Dumitras, D., Arion, F. and E. Merce. 2011. A Brief Economic Assessment on the Valuation of National and Natural Parks: the Case of Romania. Not. Bot. Hort. Agrobot. Cluj 39(1): 134-138.

#### replacement costs

Used to value the wastewater treatment services provided by Nakivubo Swamp, Kampala (Uganda).

Looked at the cost of replacing wetland wastewater processing services with artificial technologies.

Found that the infrastructure required to achieve a similar level of wastewater treatment to that provided by the wetland would incur costs of up to US\$3 million.

Emerton, L., Iyango, L., Luwum, P., and A. Malinga, 1999, The Economic Value of Nakivubo Urban Wetland, Uganda, IUCN Eastern Africa Regional Office, Nairobi.

#### damage costs avoided

Used to value water regulation and flood control functions of forests in Aceh.

Looked at impacts of deforestation on downstream flood intensity and timing. Related this to the costs associated with damage to houses, roads, crops and human health.

Found an annual economic value for flood prevention under forest conservation scenario of US\$ 105 million.

Van Beukering, P., Grogan, K., Hansfort, S. and D. Seager. 2009. An Economic Valuation of Aceh's forests: The road towards sustainable development. Report R-09/14, Institute for Environmental Studies, VU University, Amsterdam.

#### contingent valuation

Surveys administered to tourists in Slovensky Raj National Park, Slovakia.

Survey offered the possibility of donating to species conservation fund through annual earmarked payments. Respondents asked to make bids, additional to their current travel costs.

Found that tourists willing to pay average of €23 towards financing National Park conservation.

Getzner, M. 2009. Valuation of Ecosystem Services in Tatra and Slovensky Raj National Parks. WWF for Nature Danube Carpathian Programme, Vienna

## what kind of valuation?

- Coverage, staffing and length of study depends on:
  - Purpose of the study
  - Time and budget available
  - Level of detail/complexity required
- If making a general point/raising awareness, can often be short
- If actually informing a policy, price or intervention, better to be more detailed
- Almost always require economic, social and biophysical inputs and expertise
- If you want to change something, you have to communicate and target the findings strategically

# Thank You for your attention
